

DELFT UNIVERSITY OF TECHNOLOGY
Faculty of Civil Engineering and Geosciences

Soil Mechanics I – MOCK EXAM II

CT1091

BSc EXAMINATION 2012

ANSWER BOOK

FOURTH PERIOD

Answer ALL Questions
(Note that the questions carry unequal marks)

Other instructions

Write your name and student number on each sheet

Clearly identify the answer in the answer box

Question No.	Workings	Answer
1a		
1b	<p>5 x 17.5 = 87.5 kPa as pore water will take all additional load until water can drain.</p>	87.5 kPa
1c	<p>Prior to construction can be calculated from either volumetric weight as is 1a or by averaging values at top and bottom of layer.</p> <p>Centre of silty clay, NAP = -5.25 m Pore pressure = 7.5 + (42.5-7.5)/2 = 25 kPa Total stress = 46 + (102-46)/2 = 74 kPa Effective stress = 74 - 25 = 49 kPa</p> <p>Centre of clay, NAP = -11.5 m Pore pressure = 42.5 + (132.5-42.5)/2 = 87.5 kPa Total stress = 102 + (255-102)/2 = 178.5 kPa Effective stress = 178.5 - 87.5 = 91 kPa</p> <p>Pore pressure remains the same after excess pore pressure have dissipated, therefore total stresses and effective stresses all increase by 87.5 kPa. Therefore total stresses are: 161.5 kPa and 266 kPa and effectives stresses are 136.5 and 178.5 kPa.</p>	<p>Before Total stresses: 74 kPa 178.5 kPa Effective stresses: 49 kPa 91 kPa</p> <p>After Total stresses: 161.5 kPa 266 kPa Effective stresses: 136.5 kPa 178.5 kPa</p>
1d	$\varepsilon = \frac{1}{c_p} \ln \left(\frac{\sigma}{\sigma_1} \right)$ $\frac{1}{8} \ln \left(\frac{136.5}{49} \right) = 0.128, \text{ deformation} = 0.128 \times 3.5 = 0.45 \text{ m}$ $\frac{1}{14} \ln \left(\frac{178.5}{91} \right) = 0.048, \text{ deformation} = 0.048 \times 9 = 0.43 \text{ m}$ <p>Total = 0.45 + 0.43 = 0.88 m</p>	0.88 m

Question No.	Workings	Answer
1e	<p>Spacing is 500m therefore maximum $r = 250\text{m}$</p> <p>Head loss can equal the current hydraulic head, i.e. $132.5 / 10 = 13.25\text{ m}$</p> <p>For a confined aquifer of $H=10\text{m}$</p> $h = h_0 + \frac{Q_0}{2\pi kH} \ln\left(\frac{r}{R}\right)$ $h - h_0 = -13.25 = \frac{Q_0}{2\pi \times 5.9 \cdot 10^{-6} \times 10} \ln\left(\frac{0.125}{250}\right)$ $Q_0 = 0.0006462\text{ m}^3/\text{s} = 2.3\text{ m}^3/\text{hour}$	$Q_0 = 2.3\text{ m}^3/\text{hour}$

Question No.	Workings	Answer																														
2a	<p>Stress increase, assuming most load comes from the oil = $20 \times 1300 \times 10 / 1000 = 260 \text{ kPa}$</p> <p>Strain, $\varepsilon = m_v \times \sigma$ Deformation = $\varepsilon \Delta h$</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>Depth, m</th> <th>Compressibility coefficient, m_v (kPa^{-1})</th> <th>Thickness of layer, m</th> <th>Strain</th> <th>Deformation, m</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>0.0001</td> <td>2</td> <td>0.026</td> <td>0.052</td> </tr> <tr> <td>4</td> <td>8.0×10^{-5}</td> <td>4</td> <td>0.0208</td> <td>0.083</td> </tr> <tr> <td>10</td> <td>3.0×10^{-5}</td> <td>8</td> <td>0.0078</td> <td>0.062</td> </tr> <tr> <td>21</td> <td>2.0×10^{-6}</td> <td>14</td> <td>0.00052</td> <td>0.007</td> </tr> <tr> <td colspan="4" style="text-align: center;">Total</td> <td>0.20</td> </tr> </tbody> </table>	Depth, m	Compressibility coefficient, m_v (kPa^{-1})	Thickness of layer, m	Strain	Deformation, m	1	0.0001	2	0.026	0.052	4	8.0×10^{-5}	4	0.0208	0.083	10	3.0×10^{-5}	8	0.0078	0.062	21	2.0×10^{-6}	14	0.00052	0.007	Total				0.20	0.20 m
Depth, m	Compressibility coefficient, m_v (kPa^{-1})	Thickness of layer, m	Strain	Deformation, m																												
1	0.0001	2	0.026	0.052																												
4	8.0×10^{-5}	4	0.0208	0.083																												
10	3.0×10^{-5}	8	0.0078	0.062																												
21	2.0×10^{-6}	14	0.00052	0.007																												
Total				0.20																												
2b	<p>$k = 7.8 \times 10^{-9} \text{ m/s}$ $m_v = 0.00003 \text{ kPa}^{-1}$ $\gamma_w = 10 \text{ kN/m}^3$</p> $c_v = \frac{k}{\gamma_w \cdot m_v} = \frac{7.8 \times 10^{-9}}{10 \times 0.00003} = 0.000026 \text{ m}^2/\text{s}$	$c_v = 0.000026 \text{ m}^2/\text{s}$																														
2c	<p>When consolidation is complete, $\frac{c_v t_{99}}{h^2} = 1.784$ but will also accept the answer for $\frac{c_v t_{99}}{h^2} = 2$</p> $\frac{1.784 h^2}{c_v} = t_{99} = \frac{1.784 \times 14^2}{0.000026} = 1.34 \times 10^7 \text{ s} = 0.43 \text{ years}$ <p>Or</p> $\frac{2 h^2}{c_v} = t_{99} = \frac{2 \times 14^2}{0.000026} = 1.51 \times 10^7 \text{ s} = 0.48 \text{ years}$	0.43 years																														

2d	<p>Could either do this by algebra or by completing the result numerically.</p> <p>1)</p> $c_v = \frac{k}{\gamma_w \cdot m_v} \text{ and } t_{99} = \frac{1.784h^2}{c_v}$ <p>Therefore, $t_{99} = \frac{1.784\gamma_w \cdot m_v h^2}{k}$</p> $h_{new} = \frac{h_{old}}{2} \text{ and } k_{new} = \frac{k_{old}}{2}$ <p>So</p> $t_{99new} = \frac{1.784\gamma_w \cdot m_v \left(\frac{h_{old}}{2}\right)^2}{\frac{k_{old}}{2}} = \frac{1.784\gamma_w \cdot m_v h_{old}^2}{2k_{old}} = \frac{t_{99old}}{2}$ <p>2)</p> <p>As in 2c, 0.21 or 0.24 years</p>	<p>New location.</p> $t_{99new} = \frac{t_{99old}}{2}$ <p>Or</p> <p>0.2 years</p>
2e	<p>Similar approach to above:</p> <p>Drainage path is twice as long, i.e. $2h_{old}$</p> $t_{99new} = \frac{1.784\gamma_w \cdot m_v (2h_{old})^2}{k} = \frac{4 \times 1.784\gamma_w \cdot m_v h_{old}^2}{k} = 4 \times t_{99old}$	Proved.

Question No.	Workings	Answer
3a	<p>Recognise that there is one stream line at the edge of the sheet pile and also one at the base. Potential lines include both soil surfaces.</p> <p><u>Option 1</u> Stream lines = 5 Potential lines = 8</p> <p><u>Option 2</u> Stream lines = 5 Potential lines = 10</p>	<p><u>Option 1</u> SLs = 5 PLs = 8</p> <p><u>Option 2</u> SLs = 5 PLs = 10</p>
3b	<p>Flow into the excavation can be calculated via: $Q = 2 \frac{n_s}{n_n} k \Delta h B$ note 2 is from symmetry.</p> <p><u>Option 1 – stream bands 3.5 or 4 is ok (half in centre), 7 potential bands</u></p> $Q_1 = 2 \times \frac{3.5}{7} 2.9 \times 10^{-5} \times 7B = 0.000203 \text{ m}^3/\text{s} /m$ $Q_1 = 0.731 \text{ m}^3/\text{hour} /m$ <p><u>Option 2 – stream bands 3.5 or 4 is ok (half in centre), 9 potential bands</u></p> $Q_2 = 2 \times \frac{3.5}{9} 2.9 \times 10^{-5} \times 7B = 0.000158 \text{ m}^3/\text{s} /m$ $Q_2 = 0.568 \text{ m}^3/\text{hour} /m$	$Q_1 = 0.731 \text{ m}^3/\text{hour} /m$ $Q_2 = 0.568 \text{ m}^3/\text{hour} /m$
3c	<p>Critical point for liquefaction is at the downstream end of the flow path.</p> <p>Two methods: calculate effective stress or calculate critical gradient.</p> <p>Critical gradient is $i_{crit} = -\frac{\gamma_s - \gamma_w}{\gamma_w} = -\frac{19 - 10}{10} = -0.9$</p> <p><u>Option 1</u> Gradient over last square is: $dH = 7/7 = 1 \text{ m}$ $dz = -0.5 \text{ m}$ $dH/dz = -2$ Risk of liquefaction</p> <p><u>Option 2</u> Gradient over last square is: $dH = 7/9 = 0.78 \text{ m}$ $dz = -1.0 \text{ m}$ $dH/dz = -0.78$ No risk of liquefaction</p> <p>Method for checking effective stress:</p> <p><u>Option 1</u> Total stress at base of last square = $0.5 \times 19 = 9.5 \text{ kPa}$ PWP due to gravity = $0.5 \times 10 = 5 \text{ kPa}$ PWP due to flow = $dH \gamma_w = 1 \times 10 = 10 \text{ kPa}$ Effective stress = $9.5 - (5 + 10) = -5.5 \text{ kPa} < 0$ therefore at risk.</p>	Yes, option 1.

Question No.	Workings	Answer
4a	$n = V_v / V$ Volume of sample, $V = 225 \times 50^2 \times \pi / 4 = 4.42 \times 10^5 \text{ mm}^3 = 0.000442 \text{ m}^3$ Volume of solid from water = $0.197 / 1000 = 0.000197 \text{ m}^3$ Volume of voids = $0.000442 - 0.000197 = 0.000245 \text{ m}^3$ $n = 0.000245 / 0.000442 = 0.554$	$n = 0.554$ or 55.4 %
4b	Mass of saturated soil = $612 + 0.000245 \times 1000 \times 1000 = 857 \text{ g}$ Weight = 8.57 N or 0.00857 kN Saturated volumetric weight, $\gamma = 0.00857 / 0.000442 = 19.4 \text{ kN/m}^3$ Mass of dry soil = 612 g = 0.00612 kN Saturated volumetric weight, $\gamma_d = 0.00612 / 0.000442 = 13.9 \text{ kN/m}^3$	$\gamma = 18.3 \text{ kN/m}^3$ $\gamma_d = 13.9 \text{ kN/m}^3$
4c	Degree of saturation, $S = V_w / V_v$ Initial water mass = $721 - 612 = 109 \text{ g} = 0.109 \text{ kg}$ Initial water volume = $0.109 / 1000 = 0.000109 \text{ m}^3$ $S = 0.000109 / 0.000245 = 0.445$ or 44.5%	$S = 0.445$ or 44.5 %
4d	Volume of soil particles = 0.000197 m^3 Density, $\rho_s = M_s / V_s = (612 / 1000) / 0.000197 = 3107 \text{ kg/m}^3$	$\rho_s = 3100 \text{ kg/m}^3$
4e	Void ratio, $e = \text{Volume pores} / \text{volume solid}$ $= 0.000245 / 0.000197 = 1.24$	$e = 1.24$
