CATERPILLAR® PERFORMANCE HANDBOOK

a CAT® publication by Caterpillar Inc., Peoria, Illinois, U.S.A.

OCTOBER 2000

Performance information in this booklet is intended for estimating purposes only. Because of the many variables peculiar to individual jobs (including material characteristics, operator efficiency, underfoot conditions, altitude, etc.), neither Caterpillar Inc. nor its dealers warrant that the machines described will perform as estimated.

Materials and specifications are subject to change without notice.

Printed in U.S.A.

© 1979-2000 Caterpillar Inc.

SEBD0341

PREFACE

Machine performance must ultimately be measured in unit cost of material moved, a measure that includes both production and costs. Factors bearing directly on productivity include such things as weight to horsepower ratio, capacity, type of transmission, speeds and operating costs. The Performance Handbook considers these factors in detail. There are other less direct machine performance factors for which no tables, charts or graphs are possible. Serviceability, parts availability and operator convenience are examples. In comparing machine performance, all factors should be considered. This Handbook is intended as an aid which, when coupled with experience and a good knowledge of local conditions, can assist in estimating true machine performance.

Many sections of the Handbook include tables or curves showing cycle times or hourly production figures for Caterpillar machines under certain conditions. Statements of conditions always accompany or precede the curves or tables. Before using any performance information in this Handbook, a complete understanding of the qualifying conditions is essential. The data is based on field testing, computer analysis, laboratory research and experience; and every effort has been made to assure their correctness.

However, all such data is based upon 100% efficiency in operation — a status which cannot be achieved continuously even under ideal conditions. Thus, in using such performance and production data, it is necessary to correct the results indicated in the handbook tables by appropriate factors. This allows for the anticipated actual job efficiency, operator efficiency, material characteristics, haul road conditions, altitude and other factors which may reduce performance or production on a particular job.

Methods for estimating machine owning and operating costs vary widely, depending on locality, industry practices, owner preferences and other factors. One method is suggested in the Handbook section on Owning and Operating Costs. When used with good judgment, it has provided reasonably accurate estimates in the past. Included in the Owning and Operating Section are guidelines, based on working conditions, to assist in estimating consumption of fuel and lubricants, tire life and repair costs for Caterpillar machines. However, what one Handbook user regards as “excellent” conditions, another may consider “severe” or “average”, depending on his own experience and basis of comparison. Therefore, these guidelines should be considered only approximations.

Caterpillar Inc. has made every effort to assure that the information contained in this Handbook is accurate and is a fair statement of the results to be achieved in the circumstances indicated. However, because of the many variables involved in estimating the production or performance of earthmoving machinery, their consumption of fuel and lubricants, tire life and repair costs, and the possibility of inadvertent errors or omissions in assembling this data, Caterpillar cannot and does not imply that all data in this book are complete nor that this level of performance will be achieved on a given job.

Specifications shown in this Handbook were current at time of printing. However, due to Caterpillar’s many machine improvement programs, specifications and materials may change without notice. For current specifications relating to a machine’s performance, please refer to the most recent Caterpillar product specification sheet.

Caterpillar Inc.

OPERATOR AND MACHINE PROTECTION

A well trained operator, working under suitable conditions, utilizing a modern, properly-equipped machine provides a machine-operator team capable of giving maximum production. These factors, along with appropriate job site rules and communication procedures, are essential to coordinate people and machines working together. Appropriately protected and maintained machines are less likely to suffer premature component failure or damage, and give operators the confidence and assurance they need to carry out their work. Furthermore, training is not complete until the operator reads, understands and agrees to follow the instructions provided in the Operation and Maintenance Manual included with every Caterpillar machine.

Employers have a duty to provide a safe work place for their employees. The purchaser of a Caterpillar machine has a duty to review his/her particular application and job site for the machine to identify potential hazards inherent to that application or job site. Based on the results of this hazard analysis, the appropriate operator and machine protection configuration can be determined.

Caterpillar designs, builds, and tests its products to ensure the safety of operators, maintenance persons, service persons, and bystanders. Caterpillar provides as standard equipment the appropriate operator and machine protection for most applications. However, particular applications may require additional operator and/or machine protection. Caterpillar offers related options for most such applications. However, there may be very special applications where the Caterpillar Dealer or the Purchaser may want to fabricate, or request Caterpillar to provide, custom or special guarding. Your Caterpillar Dealer can help you with this hazard analysis and guarding configuration process.

I. Operator Training and Protection Practices

Remember that any kind of machine or mechanical device can be hazardous if not kept in good condition, or if operated by careless or improperly trained operators, or if operated in an irresponsible manner.

Listed below are some recommended basic steps that can be broadly applied to most work environments:

- Train operators for the job they are assigned to do. The length and type of training must comply with governmental and local regulations wherever they apply. As an example, machine operators in mining activities must be trained in accordance with Mine Safety and Health Administration (MSHA) regulations. Where specific regulations do not apply, no operator should be assigned to a job until he or she meets the following minimum requirements:
  - Completes proper training to operate the assigned machine and understands that seat belts must be worn whenever seated in operator's compartment.
  - Reads and understands the Operation & Maintenance manual for that machine, and knows that a copy of that manual is stored in the operator's compartment.
  - Reads and understands the EMI (Equipment Manufacturer's Institute), CIMA (Construction Industry Manufacturers Association), or any other furnished manual related to rules for safe machine operation and identification of hazards.
  - Has appropriate personal safety equipment and knows how to use it. This includes such things as hard hat, gloves, safety glasses, hearing protection and safety shoes.
  - Knows what the job requirements are, what other machines are working in the area, and is aware of any hazardous conditions that may arise.
- Be sure operators are alert and in proper physical and mental condition to perform their work assignments safely. No machine should be operated by a person who is drowsy, under the affect of medicines or drugs, suffers blackouts, or is suffering from any physical or mental distraction that could contribute to unsafe operation.

- Maintain proper job conditions and working procedures. Check the job for possible hazards, both above and below ground level. Look for all possible sources of danger to the operator and others in the area. Pay particular attention to conditions which may be hazardous or near the operating limits of the machine: e.g., side slopes, steep grades, potential overloads, etc. Examine the work site for restricted traffic patterns, obstructed views, congestion, etc. Hazardous work conditions should be corrected wherever possible and adequate warnings should be posted when applicable.
- Provide the correct machine to handle the job and equip it properly for the job to provide the necessary operator protection. Check for compliance with all applicable governmental and local regulations. It is the machine owner's or employer's legal responsibility to see that his equipment complies with, and is operated in accordance with, all such requirements.
- Make sure the machine is properly maintained. A walk-around inspection should be performed at the beginning of each shift before the machine is placed in operation. If this inspection reveals any problems that could affect safety, the machine must not be operated until these problems are corrected. Some examples include:
  – Loose, bent or missing grab irons, railings or steps;
  – Worn, cut or missing seat belts (any seat belt over three (3) years old must be replaced regardless of condition);
  – Damaged windows in the operator's compartment;
  – Worn, rubbing or abraded electrical insulation and hoses;
  – Any fluid leaks; and
  – Missing or damaged guards.

  It is the machine owner's or employer's responsibility to ensure the machine is properly maintained. Your Caterpillar Dealer will be glad to assist you in selecting and equipping the machine best suited for your job and in providing maintenance for your machines.

II. Machine Modifications

Modifications must not be made to the machine that:

– Interfere with operator visibility;
– Interfere with ingress, egress from the machine;
– Exceed the rated payload or gross combination weight of the machine resulting in overloading the braking and/or steering system or the rollover protective structure (ROPS) capacity rating (shown on a plate affixed to the ROPS); or
– Place objects in the cab that intrude into the operator's space or that are not firmly fixed into place.

III. Operator-related Equipment Options

Each job presents unique conditions that must be taken into account. Consider direct dangers to the operator as well as all possible sources of distraction that could reduce operator efficiency and increase the chances of costly and dangerous mistakes. Climate-controlled, sound-suppressed cabs, and special exterior lighting are options available from Caterpillar that can address requirements of special working environments.

"Flexible" machines include hydraulic excavators (track-type, wheel-type, and compact), skid-steer loaders, backhoe loaders and integrated tool-carriers. Work tools or any tool used in hazardous applications like demolition and logging, can create a need for special operator guarding. When flying debris from impact, cutting, shearing or sweeping attachments is present, additional protective devices such as a front screen, Falling Object Guarding System (FOGS, includes top & front guarding), thick polycarbonate windshields or a combination of these is recommended by Caterpillar. Contact your Caterpillar Dealer for operator guarding options on your machine.

IV. Machine Protection

Check the job for unusually demanding conditions that could cause premature failure or excessive wear of machine components. Additional protective devices such as heavy-duty radiator guards, crankcase guards, engine enclosures, track roller guards and/or brake shields may be needed. Also, consider the use of anti-vandalism devices, such as cap locks and instrument panel guards. Contact your Caterpillar dealer for machine-protection and vandalism-prevention options for your machine.

V. Fire Prevention

Remember that most fluids on your machine are flammable!

To minimize the risk of fire, Caterpillar recommends following these basic steps:

– Remove trash (leaves, twigs, papers, etc.) that may accumulate in the engine compartment.
– Do not operate a machine if leakage of flammable fluids is noticed. Repair leaks before resuming machine operation. Most fluids used in Caterpillar machines should be considered flammable.
– Keep access doors to major machine compartments in working order to permit the use of fire fighting equipment, should a fire occur.
– Avoid attaching electrical wiring to hoses and tubes that contain flammable or combustible fluids.

– Replace any rubbing, damaged, frayed, kinked or leaking hydraulic hoses or fittings.
– Follow safe fueling practices as described in Caterpillar Operation & Maintenance Manuals, EMI or CIMA Safety Manuals, and local regulations.

As an additional safety measure, keep a 10-pound (4.5 kg) minimum fire extinguisher on the machine in a location as specified in the Operator and Maintenance Manual.

VI. Safety Regulations

Regulations vary from country to country and often within country. Your Caterpillar dealer can assist you in properly equipping your machine to meet applicable requirements. **Note: The general summaries given below are not substitutes for reading and being familiar with the appropriate local laws.**

(a) United States (US)

With a few exceptions, all machine operations in the United States are covered by federal and/or state regulations. If the machine is used in mining activities, the regulations are administered by the Mine Safety and Health Administration (MSHA). Other activities, including construction, are under regulations administered by the Occupational Safety and Health Administration (OSHA). These agencies require employers to provide a safe working environment for employees. Caterpillar has the same objective.

OSHA and MSHA have adopted criteria for ROPS, Falling Object Protective Structures (FOPS), seat belts, warning horns, back-up alarms, operator sound levels, steering systems, and braking systems. Additional operator's compartment protection may be required for machines engaged in logging, demolition and other special applications.

(b) European Union (EU)

The EU Machinery Safety Directive applies to Caterpillar machines and most work tools. It requires that the "CE mark" be applied to the product and that a manufacturer's declaration be provided. The "CE mark" indicates that safety issues have been addressed by applying the appropriate safety standards in the design and manufacture of the machine. The objective of the Safety Directive is to protect operators, spectators and maintenance personnel. Caterpillar fully supports this objective.

VII. Sound Suppression

Different marketing areas have different noise emission requirements. Noise regulations usually specify limits for operators and spectators.

(a) United States

OSHA and MSHA noise-control regulations set permissible noise-exposure limits for machine operators and employees. Operator protection from machine noise can be achieved by use of factory-built cabs as offered in the Caterpillar Price List. These cabs, when properly maintained and operated with the doors and windows closed, reduce the operator sound level for an eight-hour operating period to meet the OSHA and MSHA noise-exposure limits in effect at the date of manufacture. Variables that may be encountered on the job site, such as other nearby noise sources or noise-reflecting surfaces, may reduce the allowable work hours. If this occurs, ear protective devices may be required.

(b) European Union

Operator sound-exposure requirements for machines in Europe are very similar to the OSHA and MSHA regulations mentioned above. In addition to operator sound-exposure requirements, certain types of Caterpillar machines are subject to European Commission regulations for exterior sound levels. Caterpillar ensures its products sold in the EU comply with the applicable noise regulations.

VIII. Replacement Parts for your Caterpillar Machine

⚠ WARNING

When replacement parts are required for this product, Caterpillar recommends using Caterpillar replacement parts or parts with equivalent specifications including, but not limited to, physical dimensions, type, strength and material.
Failure to heed this warning can lead to premature failures, product damage, personal injury or death.

TRACK-TYPE TRACTORS
Hydraulic Controls
Bulldozers
Rippers & Winches
Towed Scrapers

CONTENTS

TRACK-TYPE TRACTORS

Features:

- **Cat Diesel Engines** provide power, high torque rise, reliability and performance you can depend on.
- **Hydraulic Electronic Unit Injection** on D9R and D10R increases fuel efficiency, reduces smoke, improves cold starting and enhances diagnostic capabilities.
- **Electronic Unit Injection (EUI)** on D11R. The Electronic Control Module (ECM) performs much like a mechanical governor, but has no moving parts. The ECM signals the injectors regulating the fuel supply thus controlling engine speed and power. EUI provides: Reduced exhaust smoke, automatic altitude compensation and cold start protection.
- **Oil cooled steering clutches and brakes** standard on all models except the D8R. Improves reliability and component life.
- **Finger Tip Controls (FTC)** of transmission, steering clutches and brakes optional on D5M, D6M, standard on D6R, D7R, D10R and D11R.
- **Differential steering** allows infinitely variable turning radius. Standard on the D8R and optional on the D6R, D7R and D9R, allows the tractor to make a "power turn" keeping both tracks working for more traction and higher performance.
- **Hydrostatic Power Train System** on D3C Series III thru D5C Series III allows power turns, stepless speed range, smooth modulation, dynamic hydrostatic braking, superior maneuverability and excellent controllability.
- **Combined hand lever steering** located left of operator provides easier operation on D5M XL, D6M XL and D9R.
- **Standard Tractors** designed for heavy dozing and general grading.
- **XL Tractors** offer higher horsepower and longer roller frames for increased finish grading capability, flotation and productivity. Wider gauge available on D6R XL through Caterpillar Custom Products.
- **Sealed and Lubricated Track** reduces pin and bushing wear for lower undercarriage repair costs. Heavy duty track chain available on D5M, D6M, D6R and D7R improves wear life and reduces pin/bore stretching and cracking.
- **Elevated sprockets** on D5M XL and up eliminate final drive stress induced by roller frame movement and ground impact loads. Final drives pull chain only. Seals moved up out of dirt, sand and water for longer life. Blade visibility improved because operator sits higher.
- **Resilient mounted bogie undercarriage** on D8R, D9R, D10R and D11R reduces shock transmitted to tractor.
- **Solid mounted undercarriage** standard on D3C Series III through D7R and optional on the D8R provides stable platform for low impact, high abrasion applications like finish grading and stockpiling.
- **Accessible modular design** on D5M XL and up greatly reduces drive train removal and installation time resulting in reduced repair costs.
- **Tag link** on D7R and up; L-shaped push arms on D6M through D6R. Both designs allow closer mounting of dozer blades. This reduces total tractor length, improves maneuverability, balance, blade penetration and pryout.

*Specified pull is based on nominal engine performance derated for transmission lube, control and optional implement hydraulic pumps, with corrections made for drive-line mechanical efficiency and rolling resistance on firm level ground. Usable pull will depend on particular attachments, weight and traction of equipped tractor.
NOTE: For Variable Horsepower Tractor Information, see the Agricultural Tractor section in this handbook.

◀ Standard shoe.

NOTE: Ground contact area = width of track shoe × length of track on ground × 2.

$$\text{Ground pressure} = \frac{\text{operating weight}}{\text{ground contact area}}$$

EXTREME SLOPE OPERATION

The following table gives the MAXIMUM fore and aft slope on which each tractor will have proper lubrication. Consult Operation & Maintenance Manual (if applicable) for POWER TRAIN fluid level overfill requirements for operation on extreme slopes. Extreme slope operation is anytime the slope exceeds 25° (47%).

The ENGINE should never be overfilled with oil. This may lead to rapid overheating. For extreme slope operation, engine oil should be maintained at the full mark.

NOTE: Both ENGINE and POWER TRAIN fluid levels should be checked on level ground before working sidehills and slopes.

Percent Grade or Degrees Slope	100 / 45	100 / 45*	100 / 45	100 / 45	100 / 45	100 / 45

Pipelayer	561M	572R	583R	589
Percent Grade or Degrees Slope	100 / 45	100 / 45	100 / 45	100 / 45

When working sidehills and slopes, consideration should be given to the following important points:

- Speed of travel — At higher speeds, inertia forces tend to make the tractor less stable.
- Roughness of terrain or surface — Ample allowance should be made where the terrain or surface is uneven.
- Mounted equipment — Bulldozers, sidebooms, winches, and other mounted equipment cause the tractor to balance differently.
- Nature of surface — New earthen fills may give way with the weight of the tractor. Rocky surfaces may promote side slipping of tractor.
- Track slippage due to excessive loads — This may cause downhill track to “dig in,” increasing angle of tractor.
- Implements hitched to the drawbar — This may decrease weight on uphill track, e.g., logging arch, two-wheel wagon.
- Height of hitch on tractor — When a high drawbar is used the tractor is less stable than with the standard drawbar.
- Width of shoes — Wide track shoes tend to decrease “digging in”, hence tractor is more stable.
- Operated equipment — Be aware of the stability and other performance features of the equipment operated by the tractor.
- Keep all attachments or pulled loads low to the ground for optimum stability.

*The D7G requires a 23 L (6 gal) transmission overfill for acceptable operation on slopes above 25° (47%).

NOTE: Safe operation on steep slopes may require special machine maintenance as well as excellent operator skill and proper equipment for the specific application. Consult Operation & Maintenance Manual (if applicable) for proper fluid level requirements.

HYDRAULIC CONTROLS

CONTENTS

Features:

- **Designed and built for specific tractor applications.** Valves and components sized for exacting quality and performance.
- **Job requirements matched** through various arrangements.
- **Pressure compensated control valves** for ease of operation on D6R thru D9R. Pilot operated on D10R except for dozer lift which is pressure compensated and manually operated. D11R and D11R Carry Dozer have electro hydraulic controls for all blade and ripper functions.
- **Full flow filters*...** all oil completely filtered.
- **Dual tilt** — standard on D11R, optional on D9R and D10R.

*Exception — D8R 2-pump.

Notes —

BULLDOZERS

CONTENTS

Features:

- **Straight Bulldozers** — adjustable pitch angle controls blade penetration.
- **Variable cutting edge Power Angle and Tilt (VPAT)** — blade is available on the D3C Series III, D4C Series III, D5C Series III, D5M and D6M. The blade can be mechanically tipped forward for improved penetration or back for more productivity and easier finish grading.
- **Power Angle and Tilt (PAT)** — blade is available for D6R as a custom product. Provides greater versatility for finish grading, V ditching, windrowing and medium to heavy dozing in dirt, clay, sand and other non-rock materials. Not intended for land clearing.
- **Angling Bulldozers** — 25° right/left angling; C-frame allows mounting other tools.
- **Universal Bulldozers** — 25° wings provide increased capacity, less spillage.
- **Semi-Universal Bulldozers** — combines penetration ability of straight blade with increased load capacity provided by short 25° wings.
- **Wheel Dozer blades** are straight design, with hydraulic pitch and tilt control.
- **Box-section construction** on blades adds rigidity and strength.
- **Cutting edges** are heat treated and reversible for extra life.

CATERPILLAR SUPPLIED
- S — Straight
- U — Universal
- SU — Semi-Universal
- A — Angling
- FS — Fill Spreading
- LFS — Landfill Spreading
- P — Power Angle Tilt
- VP — Variable Pitch, Lower, Angle & Tilt (VPAT)

SPECIAL SUPPLIED
- RC — Reclamation U
- WC — Woodchips
- CL — Coal
- HU — Heavy U
- LF — Landfill
- TW — Two-Way Dozer
- CU — Cushion Dozer
- CPB — Cushion Push Block
- CB — Coal Bowldozer
- VR — Variable Radius
- WCB — Wood Chip Bowldozer
- CS — Coal Scoop
- WCS — Wood Chip Scoop
- W — W-Blade

NOTE: This chart suggests a range of blade options for Caterpillar built machines. It is not totally inclusive of all blades available. For additional information consult your Caterpillar Dealer.

BLADE SELECTION

Properly matching tractor and dozer is a basic requirement for maximizing production. First consider the kind of work the tractor will be doing most of its life. Then evaluate:

- Material to be moved.
- Tractor limitations.

Materials to be moved.

Most materials are dozeable. However, dozer performance will vary with material characteristics such as:

Particle Size & Shape — The larger the individual particle size, the harder it is for a cutting edge to penetrate. Particles with sharp edges resist the natural rolling action of a dozer blade. These particles require more horsepower to move than a similar volume of material with rounded edges.

Voids — Few voids or the absence of voids means the individual particles have most or all of their surface area in contact with other particles. This forms a bond which must be broken. A well graded material, which lacks voids, is generally heavy, and will be hard to remove from the bank state.

Water Content — In most materials the lack of moisture increases the bond between particles and makes the material difficult to remove from the bank state. A high moisture content makes dozing difficult because the material is heavy and requires more force to move. Optimum moisture reduces dust and offers the best condition for dozing ease and operator comfort.

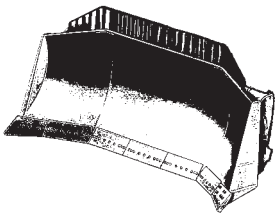
The effect of freezing depends on the moisture content. When frozen, the material's bond strengthens as moisture content increases and temperature decreases. However, freezing a completely dry material does not change its characteristics.

An indication of a blade's ability to penetrate and obtain a blade load is kW per meter (or horsepower per foot) of cutting edge. The higher the kW/meter (HP/foot), the more aggressive the blade. Kilowatt per Lm^3 (horsepower per loose cubic yard) indicates a blade's ability to push material. The higher the kW/Lm^3 (HP/LCY), the greater the blade's potential capability for carrying material at a greater speed.

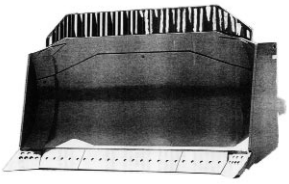
Tractor Limitations

The weight and horsepower of the machine determines its ability to push. No tractor can exert more pounds push than the machine itself weighs and its power train can develop. Various terrain and underfoot conditions on the job limit the tractor's ability to use its weight and horsepower. The "approximate coefficient of traction factors" chart in the Tables Section presents these traction factors for common materials. To use the chart, take the total tractor weight (with attachments) times the factor to arrive at the maximum usable push the dozer can exert.

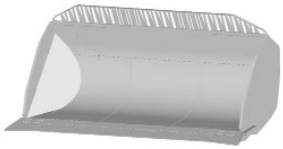
Production Dozing Tools



"U" — Universal blade — the large wings on this blade include one end bit and at least one section of cutting edge which make it efficient for moving big loads over long distances as in land reclamation, stockpile work, charging hoppers and trapping for loaders. As this blade has a lower kW/meter (HP/foot) of cutting edge than an "S" or "SU", penetration should not be a prime objective. With a lower kW/Lm^3 (HP/LCY) than an "S" or "SU", this blade is best for lighter or relatively easily dozed material. If equipped with tilt cylinder(s), it has some of the versatility of the S-blade. Tilt cylinder(s) improve its ability to ditch, pry out, and level. This extends its use to many utility tasks.

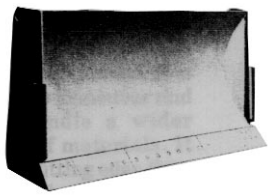


"SU" — The Semi-U blade combines the desirable characteristics of S and U-blades into one package. It has increased capacity by the addition of short wings which include only the dozer end bits. The wings provide improved load retention capabilities while maintaining the blade's ability to penetrate and load quickly in tightly packed materials and to handle a wide variety of materials in production oriented applications. Tilt cylinder(s) increase both the productivity and versatility of this dozer. Equipped with a push plate, it is effectively used for push loading scrapers.



"CD" — The CD or Carrydozer Blade is available for the D11R Carrydozer only. It is built to the same high standard of structural integrity as the "U" and "SU" Dozers. The CD Blade has a unique "bucket" shape that allows it to carry several cubic yards or cubic meters of material in the blade. This acts as a disposable counterweight that allows the Carrydozer to push more material per pass than a standard D11R. The Carrydozer will not be as effective as the "U" or "SU" dozer in tightly packed or poorly shot material. It is also more sensitive to the carry-back in sticky materials.

General Purpose Dozing Tools

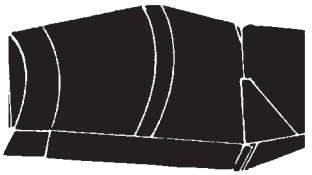


"S" — The Straight blade provides excellent versatility. Since it is physically smaller than the SU or U-blade, it is easier to maneuver and can handle a wider range of materials. It has a higher kW/meter (HP/foot) of cutting edge than the SU or U-blade; consequently, the "S" is more aggressive in penetrating and obtaining a blade load. A tilt cylinder increases both the productivity and versatility of this dozer. With a high kW/Lm^3 (HP/LCY), the S-blade can handle heavy material easily.

Power Angle and Tilt blade — Versatility is its key feature with its ability to perform a variety of site development to general dozing work as well as heavy-duty applications. Angle and tilt control is with 2 levers on some machines, 1 lever on others.

Variable Power Angle and Tilt (VPAT) blade can be mechanically tipped forward for improved penetration or shedding sticky material and backward for finish grading and improved productivity.

"VR Blades" (Variable Radius)



The Variable Radius Semi-U-Blade combines the benefits of a semi-U-blade such as "cutting" ability and ground penetration with U-blade characteristics of better load retention and less side spill.

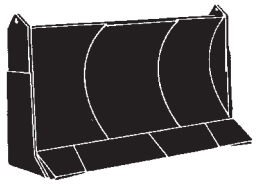
This is achieved with the variable radius moldboard. The variable radius moldboard causes dirt to move to the center of the blade creating more rolling action. The extended side plates retain the load and increase capacities.

The variable radius semi-U-blade is an excellent tool for land improvement, soil conservation, site development, or general construction.

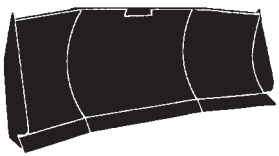
Special Application Dozing Tools

Caterpillar and other blade manufacturers provide specialty bulldozers for specific applications. The blades are designed to increase production while performing certain tasks. However, specialization may reduce the blade versatility. Following are the most popular special applications blades.

"A" — Or Angling blade can be positioned straight or angled 25 degrees to either side. It is designed for side-casting, pioneering roads, backfilling, cutting ditches and other similar tasks. It can reduce the amount of maneuvering required to do these jobs. Its "C" frame can be used for attachments such as pushing, land clearing, or snow removal tools. A-blades are not recommended for rock or severe applications.



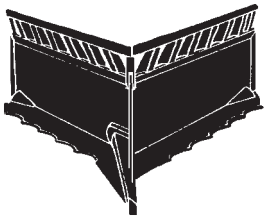
"C" — The Cushion blade is used for on-the-go push-loading. Rubber cushions allow the dozer to absorb the impact of contacting a scraper push block. When not push-loading, the dozer can be used for cut maintenance and other general dozing jobs. The narrow width of the C-blade increases machine maneuverability in congested cuts and reduces the possibility of cutting tires associated with SU and U-blades.



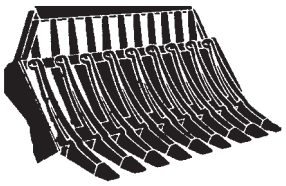
"U-Blades" — Provide high volume movement of light non-cohesive materials such as coal and woodchips. Heavier U-blades are also offered for production dozing and reclamation work.

"Landfill" — Designed to handle refuse and cover material. Open trash screen on top of blade allows good visibility and protects radiator. Curved moldboard keeps cover material rolling evenly.

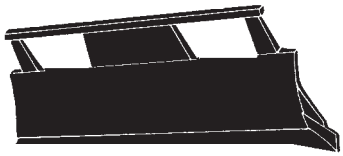
"Two-Way Dozer" — Designed for use inside ship holds to move cargo such as grain, salt, iron ore, coal and chips. These blades can scrape material off walls and doze to center of hold. They can doze material forward or pull material.



"V-Tree Cutter" — Rimco and Rome offer this clearing blade for shearing trees, stumps and brush at ground level. A sharp angle or "V", formed by two cutting blades, utilizes tractor weight and horsepower through the centerline of the cutter. Utilization of tractor force allows most growth to be cut at a steady pace and cast to the sides.

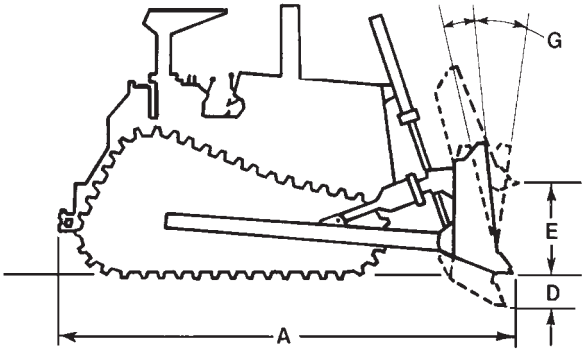


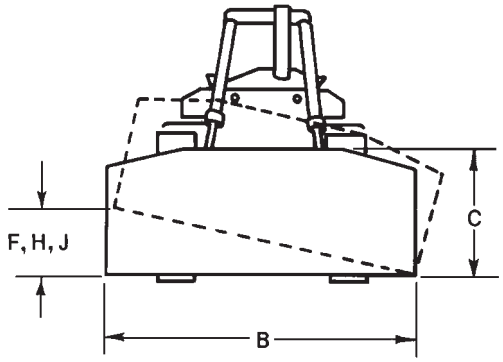
"Rakes" — Caterpillar, Rimco and Rome offer a variety of rakes for use in land clearing applications. They handle vegetation up to tree size, and offer good soil penetration for removal of small stumps, rocks and roots. In most cases rake tines are replaceable.



"K/G" — Offered by Rimco and Rome, the K/G-blade is used in many land clearing applications. In addition to cutting trees this versatile blade can pile vegetation, cut v-type drainage ditches and build woods roads and firebreaks. Weldco-Beales offers a blade of similar design called the One-Way Brush Cutter.

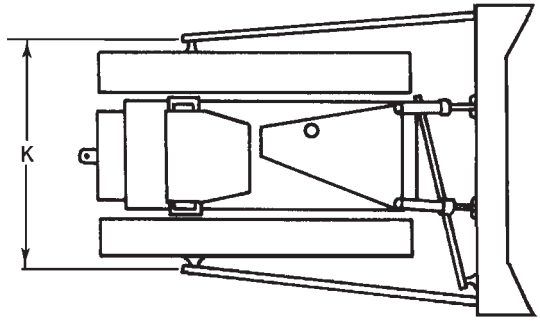
General Dimensions Key
- Tractor and Blade
- SAE Blade Capacity Definition





KEY

A Length (Blade Straight)
Blade:
B Width (including standard end bits)
C Height
D Maximum Digging Depth
E Ground Clearance @ Full Lift
F Maximum Tilt (Manual)
G Maximum Pitch Adjustment
H Maximum Hydraulic Tilt
J Hydraulic Tilt (manual brace centered)
K Push Arm Trunnion Width (to Ball Centers)



Blade capacities on the following pages are as determined by SAE recommended practice J1265. Capacities are defined as:

$Vs = 0.8\ WH^2$.

$Vu = Vs + ZH\ (W\text{-}Z)\ \tan X$.

Where: Vs = Capacity of straight or angling blade.
Vu = Capacity of semi-U or full U-blade.
W = Blade width exclusive of end bits.
H = Effective blade height considering tapered top corners, etc.
Z = Wing length measured parallel to blade width @ ground line of cutting edges.
X = Wing angle.

BULLDOZER PRODUCTION OFF-THE-JOB

You can estimate bulldozer production using the production curves that follow and the correction factors that are applicable. Use this formula:

$$\text{Production } (Lm^3/hr) \text{ (LCY/hr)} = \text{Maximum production} \times \text{Correction factors}$$

The bulldozer production curves give maximum uncorrected production for universal, semi-universal, and straight blades and are based on the following conditions:

1. 100% efficiency (60 minute hour — level cycle).
2. Power shift machines with 0.05 min. fixed times.
3. Machine cuts for 15 m (50 feet), then drifts blade load to dump over a high wall. (Dump time — 0 sec.)
4. Soil density of 1370 kg/Lm^3 (2300 lb/LCY).
5. Coefficient of traction:*
   a. Track machines — 0.5 or better
   b. Wheel machines — 0.4 or better
6. Hydraulic controlled blades used.
7. Dig 1F**
   Carry 2F**
   Return 2R**

To obtain estimated production in bank cubic meters or bank cubic yards, appropriate load factor from the Tables section should be applied to the corrected production as calculated above.

$$\text{Production } Bm^3/hr \text{ (BCY/h)} = Lm^3/hr \times LF \text{ (LCY/h)} \times LF$$

*Coefficient of traction assumed to be at least 0.4. While poor traction affects both track and wheel vehicles, causing them to take smaller blade loads, wheeled units are affected more severely and production falls much more rapidly. While no fixed rules can predict this production loss, a rough rule of thumb is that wheel dozer production falls off 4% for each one-hundredth decrease in coefficient of traction below 0.40. If, for example, coefficient of traction is 0.30, the difference is ten-hundredths (0.10), and production is 60% (10 × 4% = 40% decrease).

**This gear sequence is based on level to downhill terrain, light to medium density material, and no blade extensions such as spill plates, rock guards, etc. Exceeding these conditions may require carry in 1F, but productivity should equal or exceed "standard conditions" due to the larger loads that can be carried in 1F.

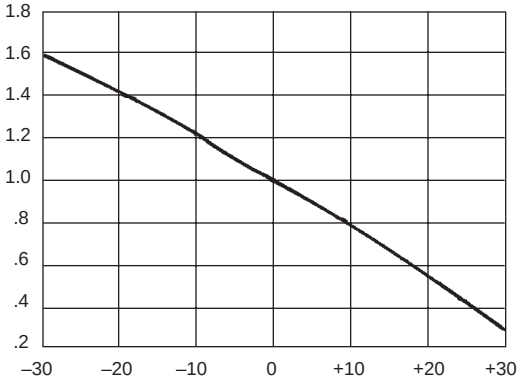
JOB CONDITION CORRECTION FACTORS

	TRACK-TYPE TRACTOR	WHEEL-TYPE TRACTOR
OPERATOR —		
Excellent	1.00	1.00
Average	0.75	0.60
Poor	0.60	0.50
MATERIAL —		
Loose stockpile	1.20	1.20
Hard to cut; frozen —		
with tilt cylinder	0.80	0.75
without tilt cylinder	0.70	—
cable controlled blade	0.60	—
Hard to drift; "dead" (dry, non-cohesive material) or very sticky material	0.80	0.80
Rock, ripped or blasted	0.60-0.80	—
SLOT DOZING	1.20	1.20
SIDE BY SIDE DOZING	1.15-1.25	1.15-1.25
VISIBILITY —		
Dust, rain, snow, fog or darkness	0.80	0.70
JOB EFFICIENCY —		
50 min/hr	0.83	0.83
40 min/hr	0.67	0.67
BULLDOZER*		
Adjust based on SAE capacity relative to the base blade used in the Estimated Dozing Production graphs.		
GRADES — See following graph.		

***NOTE:** Angling blades and cushion blades are not considered production dozing tools. Depending on job conditions, the A-blade and C-blade will average 50-75% of straight blade production.

% Grade vs. Dozing Factor

(–) Downhill
(+) Uphill



ESTIMATING DOZER PRODUCTION OFF-THE-JOB

Example problem:

Determine average hourly production of a D8R/8SU (with tilt cylinder) moving hard-packed clay an average distance of 45 m (150 feet) down a 15% grade, using a slot dozing technique.

Estimated material weight is 1600 kg/Lm^3 (2650 lb/LCY). Operator is average. Job efficiency is estimated at 50 min/hr.

Uncorrected Maximum Production — 458 Lm^3/h (600 LCY/hr) (example only)

Applicable Correction Factors:

Hard-packed clay is "hard to cut" material –0.80
Grade correction (from graph) . . . . . .–1.30
Slot dozing . . . . . .–1.20
Average operator . . . . . .–0.75
Job efficiency (50 min/hr) . . . . . .–0.83
Weight correction . . . . . .(2300/2650)–0.87

Production = Maximum Production × Correction Factors
= (600 LCY/hr) (0.80) (1.30) (1.20) (0.75) (0.83) (0.87)
= 405.5 LCY/hr

To obtain production in metric units, the same procedure is used substituting maximum uncorrected production in Lm^3.

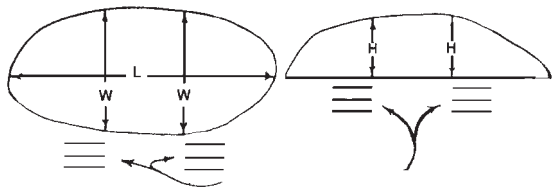
= 458 Lm^3/h × Factors
= 309.6 Lm^3/h

MEASURING PRODUCTION ON-THE-JOB

Three generally accepted methods of measuring bulldozer production are listed below. The third method is empirical, but is the simplest to conduct.

1. Employing Surveying Techniques
   a. Conduct time study and then cross-section the cut to determine the volume of material removed. (Production in Bm^3 or BCY per unit of time)
   b. Conduct time study and then cross-section the fill to determine the volume of fill material. (Production in Lm^3 or LCY per unit of time)
2. Weighing Blade Loads
   Conduct time study and weigh material moved by bulldozer by weighing the loader bucket loads.
3. Measuring Blade Loads
   a. Dozer operation
      (1) Pick up and carry load onto a level area and stop.
      (2) Raise the blade directly over the pile pulling forward slightly as blade comes up, leaving a nearly symmetrical pile.
      (3) Reverse to clear the pile.
   b. Measurements
      (1) The average *height* (H) of the pile in feet. Hold the tape vertically at the inside edge of each grouser mark. Sight along top of the pile to obtain the correct measurement.

TOP VIEW **SIDE VIEW**



GROUSER MARKS

      (2) The average *width* (W) of the pile in feet. Hold the tape horizontally over the pile and sight at the inside edge of each grouser mark and the corresponding opposite side of the pile.
      (3) The greatest *length* (L) of the pile in feet. Hold the tape horizontally over the pile and sight at each end of the pile.
   c. With the above measurements, now compute the blade load.
      (1) Average the height measurement (H)
      (2) Average the width measurement (W)
      (3) Load (Lm^3 or LCY) = 0.0138 × (HWL)
      (4) Load (Bm^3 or BCY) = Lm^3 or LCY × LF
   d. Combine the calculated blade load with time study to figure production.

Notes —

RIPPERS

CONTENTS

Features:

- **Parallelogram linkage with hydraulically variable pitch** on D8R, D9R, D10R and D11R. Operator can adjust angle of ripper tip to the material for penetration at all ripping depths to increase production.
- **Fixed Parallelogram linkage design** used on D5E, D6M, D6G, D6R, D7G, D6R XR, D6R XL, D7R and D7R XR. This design holds tooth angle constant at all ripping depths.
- **Fixed Radial rippers** are Multishank with wide beam coverage for utility ripping close to walls, footings and embankments. Ripper tooth angle changes as ripper is raised or lowered. Five shanks available on the D3C Series III, D4C Series III, D5C Series III. Three shanks available for the D5M.
- **Adjustable Single shank** arrangements available for D8R, D9R, D10R and D11R for tough ripping applications and deep ripping requirements.
- **Hydraulically Variable Pitch Multishank** arrangements available on D8R, D9R, D10R and D11R allow wide-beam coverage in easier-to-rip materials.

DEFINITION OF FORCES SHOWN IN TABLES THAT FOLLOW

"Pryout," (Breakout) newtons (and pounds) — the maximum sustained upward force, generated by the lift cylinders measured at the ripper tip. Breakout force is measured with the shank in the top hole, shank vertical and ripper full down. Breakout force may be hydraulically or balance limited.

"Penetration force," kilonewtons (and pounds) — the maximum sustained downward force, generated by the ripper lift cylinders measured at the ripper tip, which is required to raise the back end of the vehicle with the tip on ground and the shank (pinned in the top hole) vertical.

TIP SELECTION FOR THE D8R, D9R, D10R AND D11R RIPPERS

Three tip configurations (short, intermediate and long) in two styles (centerline and penetration) are available for economical operation in a variety of conditions.

RECOMMENDED TIP USAGE

Short — Use in high impact conditions where breakage problems occur. The shorter the tip, the more it resists breakage.

Intermediate — Most effective in moderate impact conditions where abrasion is not excessive.

Long — Use in loose, abrasive materials where breakage is not a problem. Generally offers the most wear material.

Centerline vs Penetration

The materials being ripped and the tractor doing the ripping will both have an effect on which tip will do the best job. High density material requires a "penetration" tip. High impact material requires a "centerline" tip. The following is a general guide to tip application.

	Tips to use		
Ripping Condition	**D8R/ D9R**	**D10R**	**D11R**
Tandem Tractors	Short	Short	Short
Single Shank & Multi-Shank			
Extreme Duty	Int.	Short	Short
Medium Duty	Long	Int.	Int.
Abrasive Duty	Long	Long	Long

Always use the longest tip that will wear without excessive breakage. Different tips should be tried to determine the most economical.

ESTIMATING RIPPING PRODUCTION

Ripping costs must be compared to other methods of loosening the material — usually drilling and blasting — on a cost per ton or bank cubic yard basis. Thus, an accurate estimation of ripper production is needed to determine unit ripping costs.

There are three general methods of estimating ripping production:

1. The best method is to record the time spent ripping, then remove (using scrapers or loaders and trucks) and weigh the ripped material. The total weight divided by the time spent will give hourly production. If the contractor is paid by volume, then a density must be used and the accuracy is only as good as the density used. For payment by volume removed, method 2 may be desirable. Some care will be needed to assure that only ripped material is removed.
2. Another method is to cross-section the area and then record the time spent ripping. After the material has been removed, cross-section the area again to determine the volume of rock removed. The volume divided by the time spent ripping gives the ripping rate per minute or hour.
3. Timing the ripper over a measured distance is the least accurate method, but valuable for quick estimating on the job. An average cycle time should be determined from a number of timed cycles. Turn-around or back-up time must be included. Measure the average rip distance, rip spacing and depth of penetration. This data will give the volume per cycle from which the production in bank cubic yards can be calculated. Experience has shown results obtained from this method are about 10 to 20% higher than the more accurate method of cross-sectioning.

An example of the measured distance method for calculating ripper production is:

Data — D10R — No. 10 with one shank.
910 mm (36 in) between passes.
1.6 km/h (1 mph) average speed (including slippage and stalls).

Every 91 m (300 ft) requires 0.25 min to raise, pivot, turn, and lower again: 91 m (300 ft) = 1 pass.
610 mm (24 in) penetration.
Full time ripping (no pushing or dozing assignment).

Example of Estimating Production (Metric)

Time per pass:

1.6 km/h = 26.7 m/min. Then $\frac{91\text{ m}}{26.7\text{ m/min}} = 3.41$ min;

3.41 min + 0.25 min (turn time) = 3.66 min/pass.

If the operator works an average of 45 min per h, it is possible to make = $\frac{45}{3.66} = 12.3$ passes per h

Volume ripped: 91 m × 0.9 m × 0.6 m = 49.1 BCM per pass

Production = 49.1 × 12.3 = 604 BCM per h

Remember the results from this method are usually 10 to 20 per cent higher than the actual production that can be expected on the job.

●●●

Example of Estimating Production (English)

Time per pass:

MPH = 88 fpm. Then $\frac{300\text{ ft}}{88\text{ fpm}} = 3.41$ min;

3.41 min + 0.25 min. (turn time) = 3.66 min/pass.

If the operator works an average of 45 min per hr, it is possible to make $\frac{45}{3.66} = 12.3$ passes per hr

Volume ripped: $\frac{300 \times 3 \times 2}{27} = 66.7$ BCY per pass

Production = 66.7 × 12.3 = 820 BCY per hr

●●●

NOTE: The demands of heavy ripping will increase the normal owning and operating costs of the tractor.

These costs should be increased no less than 30-40% in heavy ripping applications to estimate rock loosening costs.

There is no ready answer or rule-of-thumb solution to predict ripping production. Even if everything is known about the seismic velocity of the material, its composition, job conditions, equipment and operator, only a "guesstimate" can be given. The final answer must come from a production study obtained on the job site.

Sample problem (Metric)

Determine the loosening costs in the following situation:

Machine	— D10R Tractor with No. 10 Single Shank Ripper
Rip Spacing	— 915 mm
Ripper Penetration	— 610 mm
Rip Distance	— 91 m
Rip Time	— 3.41 minutes
Maneuver Time	— 0.25 minutes
Seismic Velocity	— 1830 meters per second

Assume 60 min. hour

Solution:

1. Total Cycle Time = 3.41 + 0.25 = 3.66 min

   Cycles/hour = $\frac{60\text{ min/hr}}{3.66\text{ min/cycle}} = 16.4$

2. Production per cycle = 91 m × 0.9 m × 0.6 m = 49.1 BCM/cycle

3. Production = 49.1 BCM/cycle × 16.4 cycles/h = 805 BCM/h

4. Remember results of this method are usually 10 to 20% high.

   Actual Production = 80% of 805 BCM/h = 644 BCM/h

   Or 90% of 805 BCM/h = 725 BCM/h

5. Owning and Operating Costs

   A D10R (ripping only) could have a $115.00/h O & O costs including $30/h operator.

6. Loosening Costs

   $115.00/hr ÷ 644 BCM/h = $0.179/BCM

   $115.00/hr ÷ 725 BCM/h = $0.159/BCM

   The loosening cost should range from 15.9¢ to 17.9¢/BCM

●●●

Sample problem (English)

Determine the loosening costs in the following situation:

Machine	— D10R Tractor with No. 10 Single Shank Ripper
Rip Spacing	— 3 feet
Ripper Penetration	— 2 feet
Rip Distance	— 300 feet
Rip Time	— 3.41 minutes
Maneuver Time	— 0.25 minutes
Seismic Velocity	— 6000 feet per second

Assume 60 min. hour

Solution:

1. Total Cycle Time = 3.41 + 0.25 = 3.66 min

$$\text{Cycles/hour} = \frac{60 \text{ min/hr}}{3.66 \text{ min/cycle}} = 16.4$$

2. $$\text{Production per cycle} = \frac{300 \times 3 \times 2}{27} = 66.7 \text{ BCY/cycle}$$

3. Production = 66.7 BCY/cycle × 16.4 cycles/hr
   = 1094 BCY/hour

4. Remember results of this method are usually 10 to 20% high.
   Actual Production = 80% × 1094
   = 875 BCY/hr
   or 90% × 1094 = 984 BCY/hr

5. Owning and Operating Costs
   A D10R (ripping only) could have a $115.00/hr O & O costs including $30/hr operator

6. Loosening Costs
   $115.00/hr ÷ 875 BCY/hr = $0.131/BCY
   $115.00/hr ÷ 984 BCY/hr = $0.117/BCY
   The loosening cost should range from 11.7¢ to 13.1¢/BCY

●●●

USE OF SEISMIC VELOCITY CHARTS

The charts of ripper performance estimated by seismic wave velocities have been developed from field tests conducted in a variety of materials. Considering the extreme variations among materials and even among rocks of a specific classification, the charts must be recognized as being at best only one indicator of rippability.

Accordingly, consider the following precautions when evaluating the feasibility of ripping a given formation:

— Tooth penetration is often the key to ripping success, regardless of seismic velocity. This is particularly true in homogeneous materials such as mudstones and claystones and the fine-grained caliches. It is also true in tightly cemented formations such as conglomerates, some glacial tills and caliches containing rock fragments.

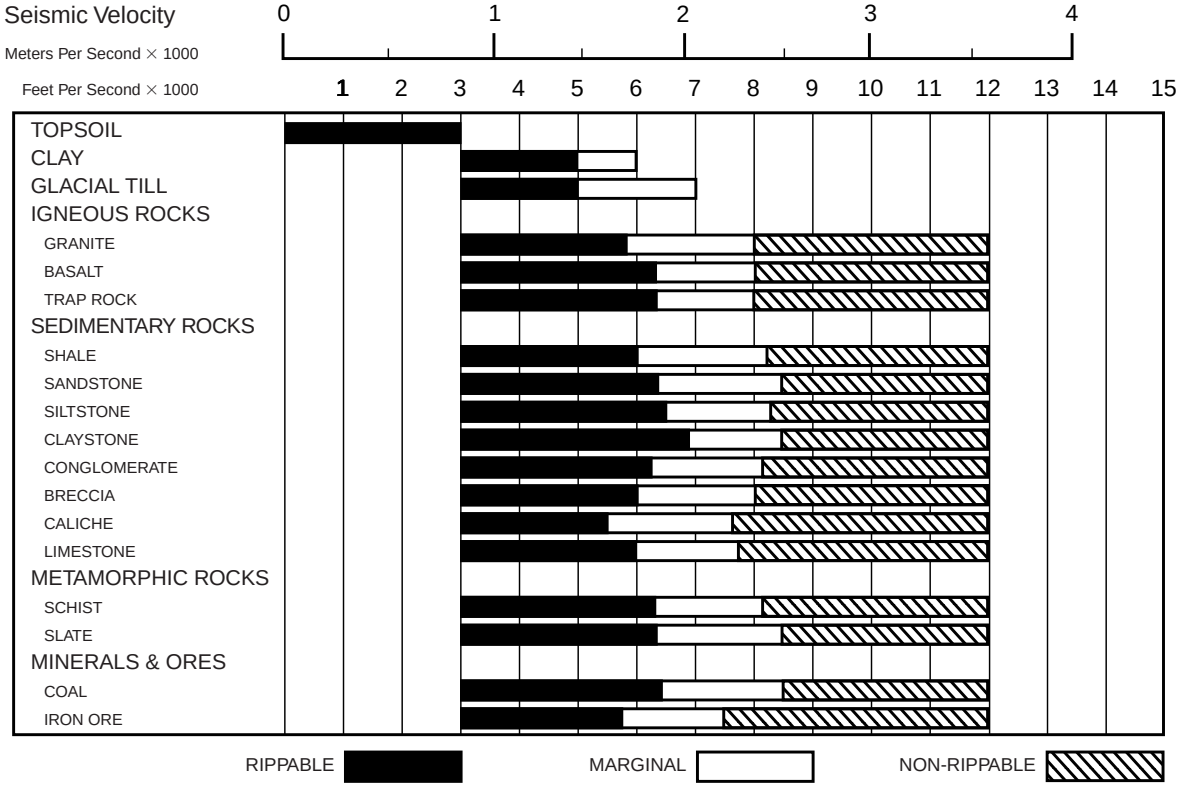
— Low seismic velocities of sedimentaries can indicate probable rippability. However, if the fractures and bedding joints do not allow tooth penetration, the material may not be ripped effectively.

— Pre-blasting or "popping" may induce sufficient fracturing to permit tooth entry, particularly in the caliches, conglomerates and some other rocks; but the economics should be checked carefully when considering popping in the higher grades of sandstones, limestones and granites.

Ripping is still more art than science, and much will depend on operator skill and experience. Ripping for scraper loading may call for different techniques than if the same material is to be dozed away. Cross-ripping requires a change in approach. The number of shanks used, length and depth of shank, tooth angle, direction, throttle position — all must be adjusted according to field conditions. Ripping success may well depend on the operator finding the proper combination for those conditions.

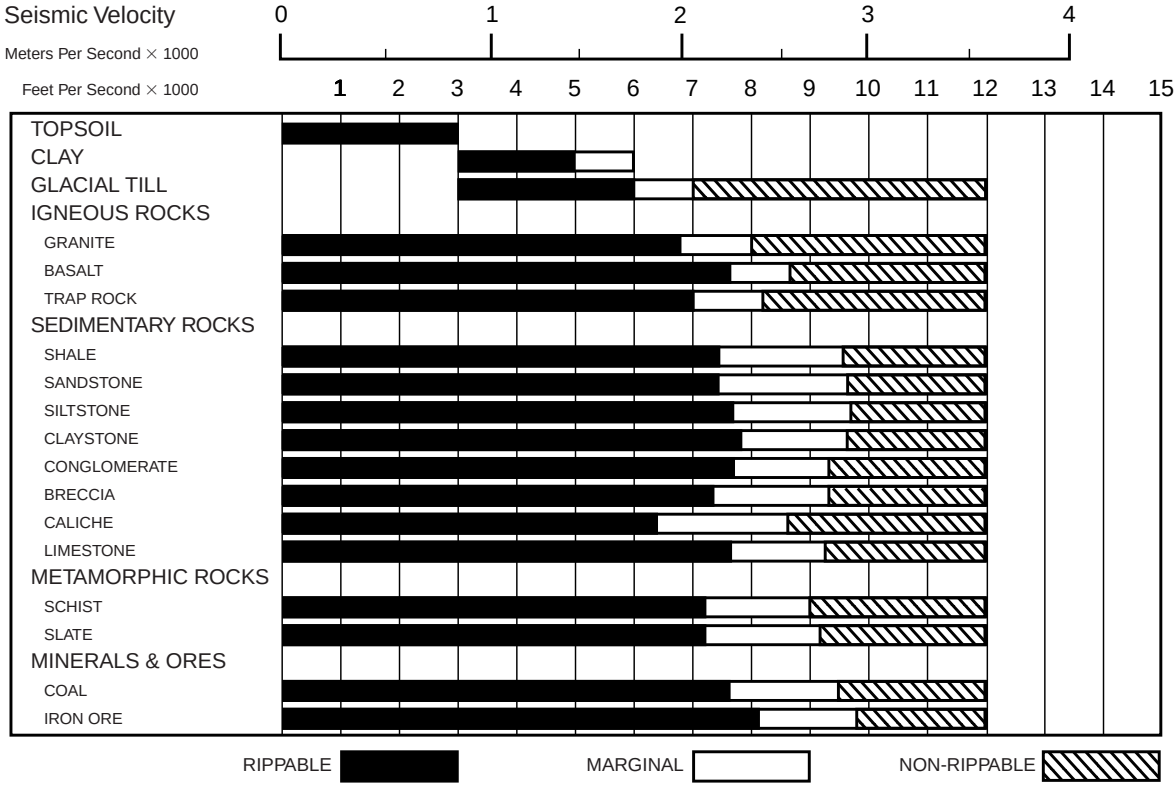
D8R

- **Multi or Single Shank No. 8 Ripper**
- **Estimated by Seismic Wave Velocities**



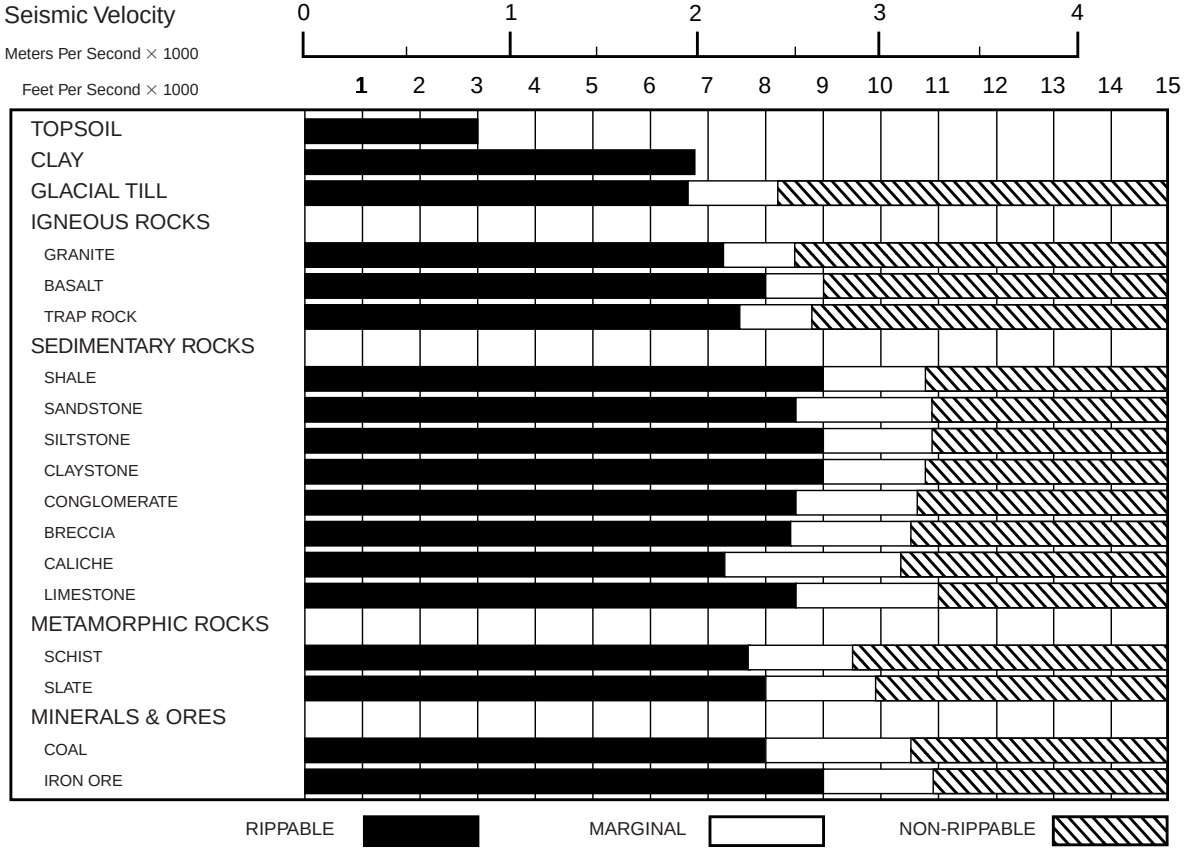
D9R

- **Multi or Single Shank No. 9 Ripper**
- **Estimated by Seismic Wave Velocities**



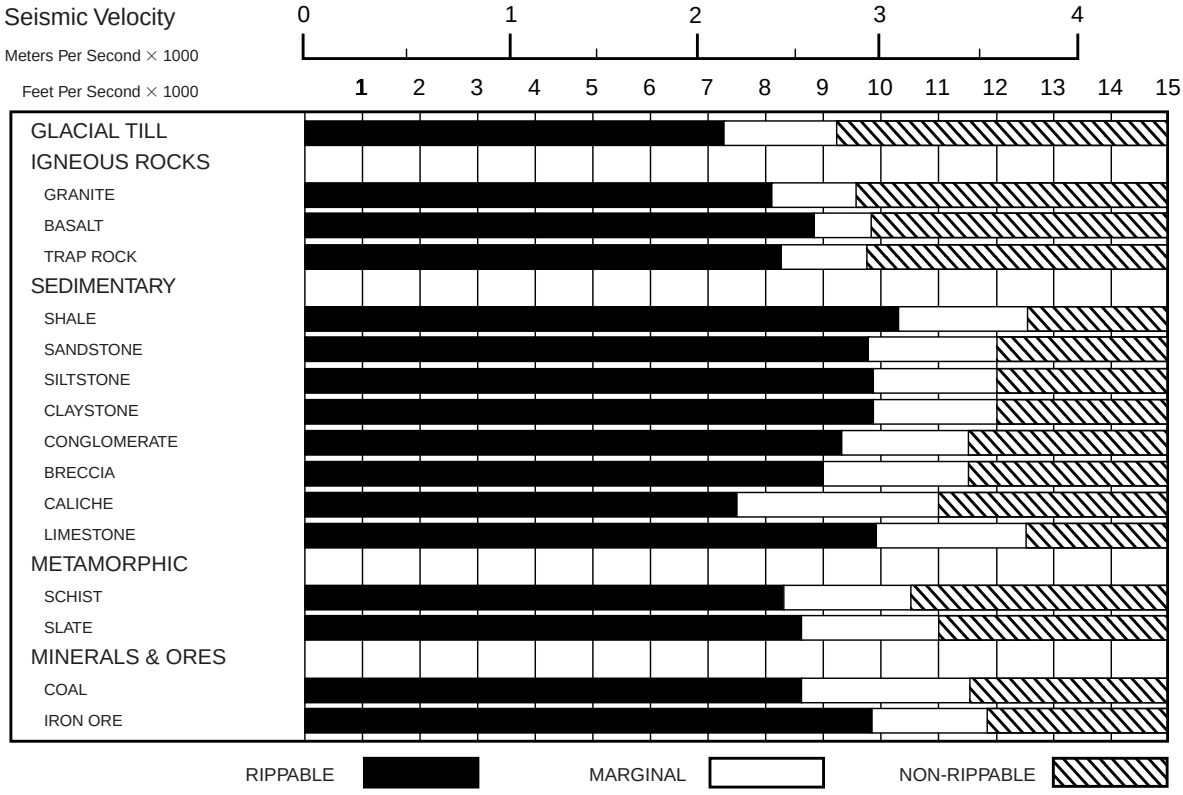
D10R

- **Multi or Single Shank No. 10 Ripper**
- **Estimated by Seismic Wave Velocities**



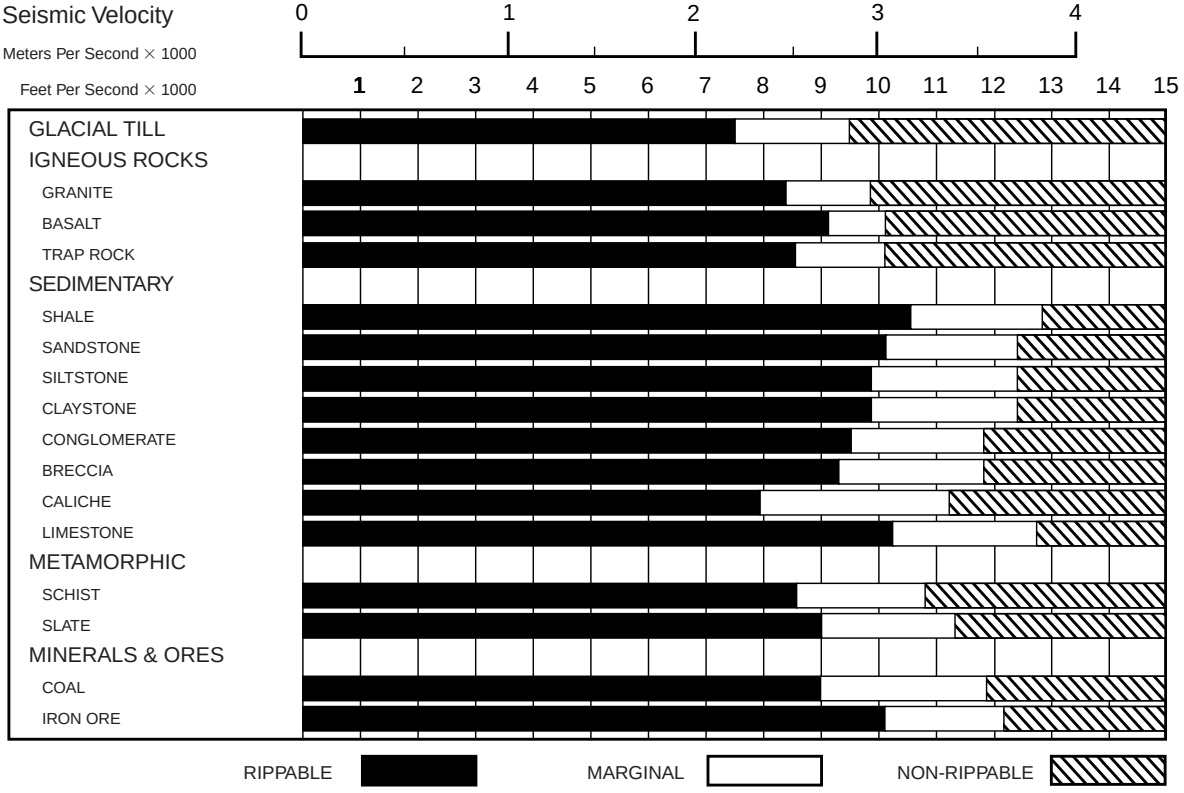
D11R

- **Multi or Single Shank No. 11 Ripper**
- **Estimated by Seismic Wave Velocities**



D11R CD

- **Single Shank No. 11 Ripper**
- **Estimated by Seismic Wave Velocities**



CONSIDERATIONS FOR USING PRODUCTION ESTIMATED GRAPHS:

- Machine rips full-time — no dozing.
- Power shift tractors with single shank rippers.
- 100% efficiency (60 min hour).
- Charts are for all classes of material.
- In igneous rock with seismic velocity of 8000 fps (2450 mps) or higher for the D11R, and 6000 fps (1830 mps) or higher for the D10R, D9R and D8R, the production figures shown should be reduced by 25%.
- Upper limit of charts reflect ripping under ideal conditions only. If conditions such as thick lamination, vertical lamination or any factor which would adversely affect production are present, the lower limit should be used.

CONTENTS

PA55 & PA56 Standard Features:

- **Rigid cast ductile case** with integral fairlead mounting lugs and heavy duty drawbar provides durable construction for long life and maximum resale value.
- **Internal Hydraulic System** with gear pump and maintenance free spring type accumulator for easy installation and maintenance.
- **Equal speed gearing** in forward and reverse to provide smooth and predictable performance.
- **Single lever control,** electronic on PA56 or cable control on PA55 for hydraulically actuated multiple disc clutches, brake, and freespool for ease of operation.
- **Freespool with drag adjustment** so the operator can easily pull wire rope from the drum by hand, permitting fast one man operation.

PA57G & Cat 59 Standard Features:

- **Adjust-free oil-disc clutches** in winch assure reliable performance day-in, day-out.
- **Input clutch** reduces parasitic horsepower loss for improved fuel efficiency.
- **Single-lever actuation** of both clutch and brake functions ... automatic synchronization of input and directional clutch engagement for smooth control.
- **Equal speed gearing** in reel-in and reel-out to provide smooth and predictable performance.

PA57VS, PA58VS & PA59VS Standard Features:

- **Variable** line pull and line speed.
- **Hydraulically driven winch** for precise load control in reel-in or reel-out.
- **Inching control** through modulation of variable displacement pump and motor.
- **Dual braking system** provides a static brake with a sprag clutch to eliminate fall back and a brake valve for dynamic braking.
- **Single lever joy stick control** for ease of operation and reliable performance with no cable nor linkage adjustments.
- **Three roller fairlead** is standard for improved wire rope life during side pulls.

CHALLENGER TRACTORS

Challenger Mid-Size Tractors

The Challenger 35, 45 and 55 tractors signal a new direction in row-crop versatility, with row spacing and horsepower to match most every cultivation, planting and tillage requirement.

Patented Mobil-trac™ Undercarriage:

- Exclusive Cat track design is industry's most advanced.
- Weight is spread across five axles, improving traction, flotation and lowering compaction.
- Translates more power to the ground for added performance, improved efficiency.
- Hardbar elastomerically mounted for reduced vibration and smooth ride.
- Two locations allow convenient chemical tank mounting.
- Proven roller frame features an in-line design, all belt tensioning stresses are contained within the unitized system.

Exclusive Belt Design:

- Broadest belt choice available: five standard widths — 406 to 813 mm (16-32") — special application, side hill and extreme service versions also available.
- Inside, patented arrangement of heavy-duty steel cables delivers maximum lateral resistance.
- Belt components are vulcanized, not molded, for excellent durability.

Gauge (Track) Spacing:

- Choice of two chassis (standard and wide-track) for maximum flexibility.
- Standard is adjustable from 1524 to 2286 mm (60-90"); wide-track from 2032 to 3048 mm (80-120").
- Adjustable in even, two-inch increments with solid, exacting settings and 100% true alignment.
- Track spacing changes made on-farm in a few hours and no special tools required.

Engines:

- Challenger 35, 45 feature Cat 3116 engine: 6.6 L (403 in^3) displacement.
- Challenger 55 features Cat 3126 engine: 7.2 L (442 in^3) displacement.
- Excellent torque rise minimizes downshifting:
  — Challenger 35, 68% PTO torque rise.
  — Challenger 45, 57% PTO torque rise.
  — Challenger 55, 46% PTO torque rise.
- Engine iso-mounted to tractor mainframe for simplified service and reduced vibration.

16x9 Powershift Transmission:

- Programmable electronic powershift includes sequential shift, shuttle shift, auto-shift, programmable downshift/upshift, speed matching.
- Speed range from zero to 31.37 km/h (19.5 mph).
- Optional creeper gears allow for ultra slow-speed applications.
- Final drives feature inboard planetaries.

Patented Differential Steering:

- Hydraulic/mechanical design delivers smooth, reliable steering.
- Stronger and more durable than conventional electronic systems.
- Turning under load exceeds wheel tractor's ability, particularly at 3048 mm (120") setting.

Responsive Hydraulics:

- Ample hydraulic flow at each coupler of 118 L/min (31.2 gpm), 163 L/min (43 gpm) from pump.
- Hydraulic flow levers give comforting feeling of control.
- In-cab flow controls allow convenient fine-tuning.

Comfortable Cab:

- Excellent visibility all-around.
- Eight-way adjustable air-ride suspension seat for comfort.
- Patented rubber isolation mounts reduce shock loads, smooth operator ride and reduce noise levels.
- Movable control console allows adjustment for individual comfort (Deluxe cab only).
- Remote, lever actuated hydraulic couplers for easy connections.
- Lower cab sound levels than competitive track tractors.

Challenger High-Horsepower Tractors

The Challenger E-Series tractors take performance in the high-horsepower category to new levels. Worthy successors to the rugged Caterpillar D-Series, and the fifth generation to the original Challenger 65 introduced 14 years ago.

Patented Mobil-trac™ Undercarriage:

- Exclusive Cat track design is industry's most advanced.
- Weight is spread across six axles, improving traction, flotation and lowering compaction.
- Translates more power to the ground for added performance and improved efficiency.
- Designed as an integral part of the Challenger tractor, not an "add-on."
- Bogie undercarriage system absorbs shock loads, follows ground contours and smoothes ride.
- Choice of two drive wheels (chevron or heavy-duty slotted cast-iron).

Exclusive Belt Design:

- Widest belt choice available: four belt widths — 635 mm, 698 mm, 762 mm and 889 mm (25", 27.5", 30", 35") — in standard, special application, reinforced and side-hill versions.
- Inside, patented arrangement of heavy-duty steel cables delivers maximum lateral resistance.
- Belt components are vulcanized, not molded, for excellent durability.

Gauge (Track) Spacing:

- Standard 2286 mm (90") spacing provides superior debris rejection and stability.

Engines:

- Challenger 65E, 75E: Cat 3176C engine: 10.3 L (629 in^3) displacement.
- Challenger 85E, 95E: Cat 3196 engine: 12 L (732 in^3) displacement.
- Excellent torque rise minimizes downshifting:
  — Challenger 65E, 37% PTO torque rise.
  — Challenger 75E, 41% PTO torque rise.
  — Challenger 85E, 42% PTO torque rise.
  — Challenger 95E, 43% PTO torque rise.
- PTO power reserve of 10% at 1900 rpm on 95E allows exceptional pull-through in tough spots.
- Engine iso-mounted to tractor mainframe for simplified service and reduced vibration.

10x2 Full Powershift Transmission:

- Dependable and proven; single in-line lever provides smooth on-the-go shifting in all gears.
- Speed range from zero to 31.7 km/h (19.7 mph).
- Inching pedal permits tight-quarter maneuvers; no need for high-maintenance master clutch.
- Fully hydraulic brake control reduces pedal effort.

Patented Differential Steering:

- Hydraulic/mechanical design delivers smooth, reliable steering.
- Effortless full-power turns under load.
- "Straight-line" tracking allows straight forward pulling with minimal operator input.

Responsive Hydraulics:

- Ample hydraulic flow at couplers of 151 L/min (40 gpm).
- Power-beyond ports (standard) allows flow directly to implement orbital motors or fans.
- Remote, lever-actuated hydraulic couplers for easy connections.
- In-cab flow controls allow convenient fine-tuning.
- Hydraulic levers on the cab console positioned for easy control.

Comfortable Cab:

- Excellent visibility all-around — roomier, brighter, quieter cab improves productivity.
- Eight-way adjustable air-ride suspension seat.
- Fully padded trainer seat with retractable seatbelt.
- Isolation mounts absorb shock loads for smoother ride.
- Exclusive Caterpillar Information Display (optional) provides on-going log of maintenance data, field totals and fuel consumption.

VERSATILE FLOTATION SYSTEM (VFS)

The heavy-duty VFS trailer system offers an extremely flexible hauling and spreading platform for grain wagons, spray tanks and other equipment.

Solid Construction:

- Six axles per track roller frame spread out axle loads, lower rolling resistance.
- VFS 50 — four pressed high-strength low-alloy (HSLA) steel midwheels, two steel idlers.
- VFS 70 — ductile-iron midwheels; an additional layer of steel on idlers' outer diameter increases strength and load-carrying capacity.
- Dual tapered roller bearings on idlers and midwheels improve performance.
- Air-spring tensioning system allows recoil for material flow between belt and idlers.
- Exclusive 762 mm (30") belts feature 96 tread bars and a 40-degree tread-bar pattern for traction, low vibration. Circumferential rib configuration belts also available in 762 mm (30") or 635 mm (25") widths. Grooves in belt are 22 mm (0.86") deep and provide smooth, vibration free operation.

Adaptable:

- VFS 50 and 70 available in three configurations: hitch and frame, wide axle, or narrow axle.
- VFS 70 wide- and narrow-axle configurations include bracket-mounting location for weight scale.
- Each roller assembly oscillates up to 17 degrees, independent of the other, for a smooth ride.
- No lubrication required: special seals eliminate need for periodic greasing of midwheel and idler bearings.

Applications:

- Include but are not limited to the following:
  - — Grain transport.
  - — Sugar cane, vegetable or sugar beet hauling.
  - — Lime spreading.
  - — Anhydrous ammonia injection.
  - — Sludge hauling.
  - — Herbicide spreading.
  - — Side-dump carts.
  - — Air seeding.
  - — Manure spreading.
  - — Construction uses include rear dump boxes and waste haulers.

LEXION® COMBINES

After years of research, development and field testing, Caterpillar is pleased to offer the Lexion line of combines. This line represents the most significant advancement in combine technology and performance in more than two decades.

Headers:

- Auto-Contour automatically adjusts header height and tilt when traveling over uneven terrain.
- Automatic reel control synchronizes reel speed to travel speed and reel height to crop height.
- Auto-Pilot guidance system on corn heads offers "hands-free" steering control by sensing row location.
- Retractable fingers across the full length of the auger ensures that crop flows evenly into the feederhouse.
- Hydraulic header reverser for positive high-torque back-up of header and feederhouse to clear blockages.
- Multi-Link connector provides quick and simple hydraulic and electrical hook-up with just one connection point.

Threshing:

- Exclusive Accelerated Pre-Separation (APS) system separates out up to 30% of the grain before it moves to the threshing cylinder and ensures constant, even crop flow to the main threshing cylinder.
- At 1700 mm (67") the threshing cylinder is the widest in the industry (460, 465, 480 and 485).

Separation:

- Lexion 460 and 465 combines have six high-performance straw walkers, the 450 has five.
- Lexion 470, 480 and 485 combines use dual-rotor separation — a gentle, centrifugal-force system that produces high quality grain.

Cleaning:

- The long preparation pan, dual ventilation, and optional remote electric adjustment of the upper and lower sieves are exclusive to the Lexion.
- The optional 3-D sieve system compensates for slopes of up to 20%.
- Turbine fans are sectional, providing even air flow across the entire width of the cleaning area.

Engines:

- Lexion 450, 460, 465 and 470 combines feature the Cat 3126 engine — a 7.2 liter (439 cu. in.) engine producing 186 kW (250 hp) on the 450 and 216 kW (290 hp) on the 460/465.
- Lexion 480 and 485 combines are powered by the Cat 3176C engine — a 10.3 liter (629 cu. in.) engine producing 272 kW (365 hp).

Tracks and Tires:

- Lexion 465 and 485 combines feature Caterpillar's exclusive Mobil-trac™ undercarriage that provides greater flotation, sidehill stability and reduced soil compaction.
- Lexion 450, 460, 470 and 480 combines are available with a number of different tire options to fit all applications.
- A powered rear axle is available on all six combines.

SUPER RURAL TRACTORS

- **Cat diesel Engines** with large piston displacement and individual adjustment-free fuel pumps and valves. High drawbar power for all day hard work, season after season.
- **Sealed and Lubricated Track** greatly reduces internal pin and bushing wear for lower undercarriage maintenance costs.
- **Direct drive transmission** helps deliver maximum engine power to the drawbar. Closely spaced speeds match implement requirements.
- **Excellent balance** with weight forward and low center of gravity.
- **Easy maintenance** with spin-on fuel filter, two-piece master link, hydraulic track adjusters. Power train oil dipstick and filler spout are within easy reach from ground level.
- **Variable horsepower arrangements** are available for increased production in high speed tillage operations.

*Specified pull is based on nominal engine performance derated for transmission lube, control and optional implement hydraulic pumps, with corrections made for drive-line mechanical efficiency and rolling resistance on firm level ground. Usable pull will depend on particular attachments, and weight and traction of equipped tractor.

LEON Model 4000 Series Dozer Blades
Challenger 65E, 75E, 85E, 95E

Blade Height	1120 mm	**44"**
Blade Widths	3048 mm	**10'**
	3658 mm	**12'**
	4267 mm	**14'**
	4877 mm	**16'**
Blade Lift Height	840 mm	**33"**
Adjustable Skid Shoes	**Standard**	
Digging Depth	300 mm	**12"**
Ripple Blade and Roll Action	**Standard**	
Replaceable Cutting Edge	**Standard**	
Hydraulic Angling (left and right)	**Standard (up to 27°)**	
Tilt Angle	**10°**	
Underframe Clearance	419 mm	**16.5"**
Complete Hydraulic Components	**Standard**	
Weight Complete with Push Assembly, 14' Blade, Hydraulics Angling and Tilt	Approx. 2550 kg	**5610 lb**

LEON Model 225 Series Dozer Blades
Challenger 35, 45, 55

Blade Height	914 mm	**36"**
Blade Widths	2743 mm	**9'**
	3048 mm	**10'**
	3658 mm	**12'**
	4267 mm	**14'**
Blade Lift Height	711 mm	**28"**
Adjustable Skid Shoes	**Standard**	
Digging Depth	254 mm	**10"**
Ripple Blade and Roll Action	**Standard**	
Replaceable Cutting Edge	**Standard**	
Hydraulic Angling (left and right)	**23°**	
Manual Angling (left and right)	**27°**	
Manual Tilt Angle	**10°**	
Hydraulic Tilt Angle	**10°**	
Underframe Clearance	356 mm	**14"**
Complete Hydraulic Components	**Standard**	

LEON Model 1000 Loader Challenger 35, 45, 55

Lift Capacity	2497 kg	**5500 lb**
Break Out Capacity	3632 kg	**8000 lb**
Lift Height (ground to bucket pin)	4077 mm	**160.5"**
Clearance Dumped	3010 mm	**118.5"**
Reach at Max. Height	914 mm	**36"**
Max. Dump Angle	**60°**	
Rollback Angle	**28°**	
Digging Depth	127 mm	**5"**
Height in Carrying Position	1981 mm	**78"**
Bucket Cylinder Diameter	76 mm	**3"**
Lift Cylinder Diameter	89 mm	**3.5"**
Quick On — Quick Off	**Standard**	
Approx. Weight with Bucket	2350 kg	**5175 lb**
Bucket Width	2438 kg	**8'**
	2743 mm	**9'**
	3048 mm	**10'**
Bucket Capacity	1.09 m^3	**1.42 yd^3**
	1.22 m^3	**1.60 yd^3**
	1.36 m^3	**1.78 yd^3**

Specialized attachments:
Gapple fork, bale spear, hay and manure fork, pallet fork, grill guard.

LEON Model C3P11 Front Mounted Hitch Challenger 35, 45, 55

Lift Capacity	2273 kg	**5000 lb**
Attachment Method	**Bolt-on using existing holes**	
Ground Clearance	476 mm	**18.75"**
Oscillation (or locked with pins)	**13°**	

Zuidberg Techiek B.V. also manufactures a front mounted three-point hitch for the Challenger 35, 45, 55 tractors. Contact Zuidberg for details.

Wilcox 3-point Hitch Challenger 65E, 75E, 85E, 95E

Category	**III/IVN/IV**	
Approx. Weight	1453 kg	**3200 lb**
Hitch Swing (left to right)	**28°**	
Drawbar Swing (left to right)	**28°**	
Lift Capacity	8172 kg	**18,000 lb**

Wilcox Drawbar Hitch Challenger 35, 45, 55

Bar Thickness	51 mm	**2"**
Wear Plates	**Yes, on drawbar and support plates**	
Drawbar Pin	**Non-rotating, 2 position**	
Vertical Load in High Position	2951 kg	**6500 lb**
Vertical Load in PTO Position	2270 kg	**5000 lb**

Utilizes existing sway blocks and PTO guard
Has drawbar rubber bumpers

DRAWBAR POWER AND TILLAGE

Tillage work ability, or rate, is measurable in drawbar power, either kilowatts or horsepower. If the quantity of work done is being emphasized, then a unit of time is also included. The common terminology is Kilowatt hours or horsepower hours.

Work rate is a combination of *load* (or force) times *distance,* divided by *time* or simply *load* times *speed.* For example a 5000 kg (11,000 lb) load pulled at 5 km/h (3.1 mph) is equivalent work to a 2000 kg (4400 lb) load pulled at 12.5 km/h (7.8 mph).

A Pullmeter is used most frequently to measure implement loads. The Towner Pullmeter is a hydraulic cylinder with a head machined precisely to 64.5 cm^2 (10 in^2). Gauges are used to read pounds per square inch thus 10 times the gauge reading gives drawbar pounds pull (DBPP) in thousands of pounds exerted by the implement pulled. Similar pullmeters are available with gauges reading in Kilograms pull.

Formulas providing either Metric or English units of work rate are:

Metric:

$$\text{Drawbar Kilowatts (DBkW)} = \frac{\text{kg Drawbar pull} \times \text{km/h}}{367}$$

$$\text{Drawbar Power} = \frac{\text{kg Drawbar pull} \times \text{km/h}}{274}$$

English:

$$\text{Drawbar Horsepower} = \frac{\text{lb Drawbar pull} \times \text{mph}}{375}$$

Example (Metric)

A 6 m implement imposes 5000 kg draft at 5 km/h requires how many drawbar kilowatts to pull it?

$$\text{Solution: } \frac{5000 \text{ kg} \times 5 \text{ km/h}}{367} = 68.1 \text{ DBkW}$$

●●●

Example (English)

A 20 ft wide implement imposing 11,000 DBPP at 3 mph requires how many drawbar horsepower to pull it?

$$\text{Solution: } \frac{11{,}000 \text{ DBPP} \times 3 \text{ mph}}{375} = 88 \text{ DBHP}$$

●●●

TILLAGE PRODUCTION

Tillage production is most commonly measured in area covered per hour, i.e. hectares per hour or acres per hour. Production can be determined by field measurement of tractor speed and implement width. If implement width is known and drawbar pull can be estimated, reference to tractor drawbar pull/speed graphs will give estimated speeds for each gear, and use of standard formulas will provide reasonable estimates of tillage production. Drawbar pull is a function of: 1) speed of tractor, 2) implement width and, 3) tillage depth.

Formulas

A. At 100% efficiency (not attainable)

Metric:

$$\text{Hectares/hr} = \frac{\text{Width (m)} \times \text{Speed (km/h)}}{10}$$

English:

$$\text{Acres/hr} = \frac{\text{Width (ft)} \times \text{Speed (mph)}}{8.25}$$

B. At 82.5% efficiency (average for tillage — includes turns)

Metric:

$$\text{Hectares/hr} = \text{meters} \times \text{km/h} \times 0.0825$$

English:

$$\text{Acres/hr} = \frac{\text{feet} \times \text{mph}}{10}$$

Example problem

Calculate normal tillage production of a D6E SR with a 6 m (20 ft) cut width disc plowing harrow pulled at a measured speed of 6 km/h (3.7 mph).

Solution:

$$\text{Hectares/hr} = 6 \text{ m} \times 6 \text{ km/h} \times 0.0825 = 3 \text{ Hectares/hr}$$

$$\text{Acres/hr} = \frac{20 \text{ ft} \times 3.7 \text{ mph}}{10} = 7.4 \text{ Acres/hr}$$

Notes —

MOTOR GRADERS

CONTENTS

Industries Served

The motor grader is one of the most versatile work tools in the Caterpillar product line. The H-Series machines are used in numerous applications within a wide range of industries. The major industries using Cat motor graders, along with the typical applications within each, are summarized below.

- **Heavy Construction**
  - Highway Construction
  - Paving/Resurfacing
  - Airport Construction
  - Railroad Construction
  - Dam and Levee Construction
  - Haul Road Maintenance
- **Governmental**
  - Road Maintenance
  - Road Construction
  - Ditch Building/Cleaning
  - Snow Removal
- **Building Construction**
  - Residential Construction
  - Commercial Construction
  - Industrial Construction
  - Sewer and Water Systems
- **Industrial**
  - Waste Disposal
  - Pipeline Construction
- **Mining**
  - Haul Road Maintenance
  - Snow Removal
- **Forestry**
  - Access Road Construction
  - Forest Development
  - Snow Removal
  - Haul Road Maintenance

Features, H-Series Motor Graders:

- **Geographic Versions** — The H-Series was specifically designed to meet the needs of different geographic regions. NA, Standard, ES and Global Versions are available with an assortment of standard features and optional equipment. All motor graders feature advanced Caterpillar engines, power train components, hydraulics and machine structures. The 24H was designed to meet the productivity and durability expectations of Caterpillar mining customers.
- **Power to the Ground** — Proven Caterpillar designed and manufactured components are carefully matched to maximize productivity and efficiency. Caterpillar H-Series engines have excellent lugging performance and fuel economy. Variable Horsepower (VHP) (NA Versions only — standard on models 143H and 163H, optional on models 120H, 135H, 140H and 160H) provides more power in gears 4F-8F and 3R-6R to increase productivity and improve gradeability when roading. Engine Power Management (standard on all ES and Standard Versions except 12H) delivers full rated power in gears 4F-8F and 3R-6R. In lower gears, where traction is limited, engine horsepower is automatically reduced, lowering fuel consumption and reducing tire slippage. All models have Caterpillar transmissions that provide on-the-go, full-power shifting and inching capability. Auto-shift is standard equipment on the 24H and optional on certain NA and ES models. In addition, the 24H is equipped with a lockup clutch torque converter which allows the machine to operate in direct drive at high output speeds.

- **Blade Positioning** — The H-Series provides a broad range of extended blade positions particularly beneficial in mid-range bank sloping, ditch cutting and ditch cleaning. A long wheel base allows for an aggressive blade angle permitting material to roll more freely, reducing power requirements.
- **Brakes** — Caterpillar designs and builds multi-disc brakes that are completely sealed, oil-bathed, adjustment-free and offer unmatched reliability and durability. They are located at each tandem wheel to eliminate braking loads on the power train and to speed up servicing. The large brake surface provides dependable braking capability and long life. The 24H brakes are oil-actuated and all other models are air-actuated.
- **Visibility** — Ample glass area and carefully placed components provide excellent visibility to enhance operator confidence and productivity in all motor grader applications. The H-Series gives the operator an exceptional view forward to the blade toe, working surface and front tires. Rearward visibility to the ripper and tandem tires and sideways to the blade heel and front tandem tires is maximized. The slanted rear window and optional sunshade reduce glare.
- **Controllability** — The H-Series features motor grader-specific hydraulic controls providing smooth, predictable response every time a lever is moved. The machines can perform multiple, hydraulic-control operations with little effect on the engine or implement speeds. The result is more production in almost any application. The Proportional, Priority, Pressure-Compensated (PPPC) Hydraulic System is load-sensing and provides hydraulic power on demand, consuming horsepower only when needed. The system provides proportionate flow to each circuit when the system demand exceeds the available flow. Lock valves, built into all control valves, maintain exact cylinder positioning. The implement valves provide superior modulation, system response and predictability.
- **Safety** — The H-Series machines provide a safe working environment for both the operator and ground personnel. ROPS and FOPS structures meeting current SAE and ISO requirements are standard on all NA, ES, and Global machines. Back-up alarms are standard on the NA, ES, and Global Version, and all models are equipped with a horn that meets ISO sound requirements. A fully hydraulic power steering system is standard on all models, ensuring precise machine control. Optional secondary steering system, available on all NA and Global Versions (standard on 24H), provides steering if the main hydraulic pump fails. Sturdy, well-placed access steps provide safe entry into the cab, and a cloth contour suspension seat with retractable seat belt (standard on NA, ES, and Global Versions) secures the operator once in the cab. The best visibility in the industry allows the operator to see what is happening around the machine. Various work and warning light packages are also available which provide even more visibility for the operator. A circle drive slip clutch, standard on all H-Series models, reduces the possibility of the grader making abrupt directional changes when hidden objects are encountered. Optional blade lift accumulators absorb vertical shocks when immovable objects are encountered, further protecting both the machine and the operator.
- **Operator Comfort** — The H-Series provides a comfortable environment to keep the operator alert and focused. Conveniently located, low-effort controls reduce fatigue. The interior noise level is maintained between 75 and 80 dBA with the doors and windows closed. Other standard and optional operator-comfort features may include (availability dependent on model):
  - key engine start-stop switch
  - pressurized cab
  - air conditioning and heating
  - fully adjustable Caterpillar Contour Series Seat
  - adjustable steering and implement control console
  - easy-to-see gauges
  - provisions for entertainment and communication radios
  - lunch box location
  - coat hook
  - sweepout cab floor
  - suspended pedals
  - cigarette lighter and ashtray
  - cupholder
  - 12 volt power port
  - lower-opening front windows
  - sliding side windows
  - speedometer/tachometer
  - hour meter
  - defroster fans
  - rear sunshade

- **Environmental Design** — The H-Series responds to important environmental concerns such as noise and air pollution. Designed with low exterior sound levels and low-emissions engines (except on Standard Version models 12H, 140H and 160H), Caterpillar motor graders are quiet and clean. Low exterior sound levels range from 80 to 84 dBA due to slower engine speeds, underhood mufflers, rubber-mounted engines, transmissions and slower fans. R134a refrigerant is used in the air conditioner. To minimize oil leaks and withstand high working pressures and temperatures, Caterpillar designed, heavy-duty XT hose and O-ring face seals are used.
- **Serviceability** — H-Series motor graders are designed for fast, easy servicing. Easy access to service areas allows for quick maintenance and ensures that routine service is performed on time. Features promoting easy servicing include:
  – Electronic Monitoring System (EMS) to alert the operator to potential problems (EMSII on the 24H)
  – easily replaceable wear inserts to keep the drawbar, circle and blade tight and prevent damage to expensive components
  – large, hinged, engine side doors to provide ample access to the engine and transmission service points (optional on Standard Versions)
  – air cleaner located above the engine, accessible from left side
  – hydraulic oil level sight gauge
  – tandem oil level sight gauge (24H)
  – oil sampling capability from engine and hydraulics
  – oil sampling capability from tandem and power train systems (24H)
  – clustered lube points located at the bolster, drawbar, articulation joint and ripper for ground-level service (24H)
  – auto-lube option available (24H)
  – diagnostic connectors for Electronic Technician (ET) (excluding 14H and 16H)
  – modular wiring harness
  – engine disconnect switch
  – fuse panel located inside the cab
  – spin on filters
  – lockable battery box cover is easily removed without tools
  – modular powertrain components
  – radiator cleanout access
  – Extended Life Coolant (ELC) extends coolant life to 6000 hours
- **143H and 163H All Wheel Drive Motor Graders** — All Wheel Drive (AWD) improves tractive performance in poor underfoot conditions such as snow, mud and sand. This feature also provides excellent steering and sidedraft control. AWD is available in gears 1F-7F and 1R-5R, making it effective in both low-speed and high-speed applications. VHP is standard on AWD models and delivers maximum power in all gears when AWD is engaged. Three operating modes are available: automatic, manual or off.
- **24H Motor Grader** — To meet the specialized needs of Caterpillar's large mining customers, the 24H is sized to maintain haul roads for large mining-truck fleets. The Caterpillar 3412E Hydraulic Electronic Unit Injector (HEUI) engine, power train components and machine structures are designed to meet the rigors of this application.
- **Best Product Support** — Caterpillar motor grader users are assured the best product support anywhere in the world. With industry-best parts availability, training and an offering of inspection, maintenance and repair, Caterpillar dealers can provide the support needed to keep the machines productive.

APPLICATIONS

The Caterpillar H-Series line of motor graders consists of 10 different models, ranging from the versatile 120H up to the rugged 24H. This broad line allows the customer to choose a motor grader that best fits the intended application. Below is a summary of the typical motor grader applications.

Finish Grading

This application involves preparing a roadway or site surface for future paving or other construction activity. The material being moved is usually a hard, dry base material on a solid underfoot. Finish blading is the motor grader application that requires the highest degree of accuracy. Thus, it is primarily done at low operating speeds — usually less than 3 mph — in gears 1 and 2. To ensure a smooth, even finished surface, one gear is usually maintained for a given pass. Pass lengths during this application are usually less than 600 m (2000 feet) for road construction and 150 m (500 feet) for site development. Most finish blading is performed by contractors in the Heavy Construction and Building Construction industries.

Heavy Blading

This application involves cutting, moving, and mixing material, usually in the initial stages of surface preparation. A variety of material types are moved in this manner, and the blade tip position varies accordingly. Full blade loads are usually experienced during heavy blading, since moving material is the primary goal. Pass lengths within this application vary, but are usually less than 600 m (2000 feet). Unlike with finish blading, the speed of the machine is dependent on the load being moved when heavy-blading material. Typical operating speeds are from 0-10 km/h (0 to 6 mph). Therefore, gears 2 through 4 are frequently used in this application. Most heavy blading activitity is performed by contractors in the Heavy Construction, Governmental, Industrial, and Forestry industries.

Site Preparation

This application involves any material cutting, moving, and mixing necessary to prepare a residential, commercial, or industrial site for construction. A variety of materials are encountered in this application. Blade loads vary depending on the activity being performed. Both heavy blading and finish blading are performed when preparing a site. Pass lengths are typically in the range of 30-300 m (100 to 1000 feet). Typical operating speeds for site preparation vary depending on whether heavy blading or finish blading activities are being performed. Most site preparation activities are performed by contractors in the Building Construction industry.

Road Maintenance

This application involves reshaping dirt or gravel roads to maintain a crown or superelevation, or restoring the surface itself. This generally involves secondary roads maintained by governmental bodies such as townships and counties. Materials being moved in this application vary from extremely hard dirt bases to moist gravel surfaces. The typical blade load falls between that of finish blading and heavy blading. Pass lengths are frequently longer than 600 m (2000 feet), and can extend for miles. The general speed range for this application is 5-16 km/h (3 to 10 mph), corresponding to gears 2 (heavy dirt) through 5 (soft gravel). As with finish blading, accuracy of the graded surface is the primary concern in this application. Thus, frequent shifts should be avoided whenever possible. A gear should be chosen and maintained unless there is a significant change in the material being moved. Most road maintenance activities are performed by the Governmental industry.

Haul Road Maintenance

This application of the motor grader involves reshaping haul roads at mining, construction, or forestry work sites, usually for the purpose of maintaining smooth travel surfaces for equipment. Materials being moved while maintaining haul roads vary widely depending on the application. Typical blade loads are about one-third to half of full capacity. Some haul roads that experience large hauling units travelling on soft material may require heavy blade loads in order to reshape the road surface. Pass lengths vary depending on the application, but can extend for miles on remote forestry or large mine haul roads. The general speed range for haul road maintenance is heavily dependent on the material being moved as well as the grade of the haul road. Many mine sites are in mountainous areas, requiring haul roads with steep grades. Generally, haul-road maintenance is performed at speeds similar to those required for general road maintenance 5-16 km/h (3 to 10 mph).

A travel surface that allows for the safe and efficient movement of machinery is the ultimate goal with this motor grader application. Very precise roadway elevations and slopes are desired, but are not as crucial as they are when finish blading. Most haul road maintenance activities are performed by the Mining, Heavy Construction, and Forestry industries.

Side/Bank Slope Work

This application involves preparing side slopes or bank slopes along roadways by placing the moldboard on a sloped surface. Slopes of up to a 2:1 angle can be cut using a motor grader. Often the motor grader is operated on the level surface adjacent to the slope, and the moldboard is extended outward to the sloped surface. Fine soils are generally encountered in this application of the motor grader. Blade loads are usually less than half of the full-blade capacity, and pass lengths are seldom longer than 600 m (2000 feet). A smooth-graded sloped surface is the primary concern in this application, so frequent shifts should be avoided. The typical speed range is 0-6 km/h (0 to 4 mph), corresponding to a gear selection of 1 to 3. The nominal speed is heavily dependent on the type of material being moved and on the slope of the surface. Most side/bank slope work is performed by the Heavy Construction and Governmental industries.

Ditch Building/Cleaning

This application involves cutting "V" and flat-bottom ditches for drainage purposes and rebuilding them when necessary. Due to excessive rain and/or poor material, ditches often need cleaning and reshaping. When building ditches, materials with a wide range of densities are encountered. Blade loads vary accordingly, from half to full-blade capacity. Pass lengths are usually less than 600 m (2000 feet). The primary objective is to move material in a manner that yields a ditch with the desired slope. Ditch building often involves cutting and moving material of high density. Therefore, typical speed ranges vary. Most ditch-building work, however, is performed in gears 1 through 3, corresponding to a maximum speed of about 8 km/h (5 mph). Ditch cleaning usually involves blading moist materials underneath a sod cover. Blade loads are usually less than half of full-blade capacity when cleaning ditches, and pass lengths are similar to those encountered in ditch building. Typical maximum speeds for this activity are similar to that of ditch building, but less of a blade load is experienced. Ditch building and cleaning activities are usually performed by the Heavy Construction and Governmental industries.

Ripping/Scarifying

This application involves conditioning hard, rough soils before they are bladed. Shanks on the ripper and/or scarifier are pushed into the ground, thus breaking up otherwise hard surfaces. Hard materials such as asphalt can also be loosened in order to make grading operations less damaging to the moldboard. Rippers and scarifiers can also be used to mix aggregates together. The materials being ripped/scarified are usually hard and dry. Rippers generally penetrate 150-300 mm (6 to 12 inches) into the ground, while scarifiers typically penetrate to a depth of 25-200 mm (1 to 8 inches). Pass lengths are generally less than 600 m (2000 feet) for both activities.

Since the material being ripped/scarified is generally hard, the typical maximum speed for this application is about 6 km/h (4 mph) gears 1-2. If the ripper/scarifier is used for mixing aggregates, the typical operating range becomes 6-20 km/h (4 to 12 mph) gears 3-6. Most ripping/scarifying activities are performed by the Heavy Construction and Governmental industries.

Snow Removal

Snow removal is the process of cutting and removing snow or ice from the roadway. In addition to the standard motor grader moldboard, other attachments such as a snow wing, V-plow, one-way plow, or reversible plow can be used to remove the snow. The moldboard itself is the most commonly used attachment for snow plowing. It is used in areas where snow depths are low, the terrain is relatively flat, and where excessive drifting does not occur. A snow wing is a moldboard that attaches to the machine's right side. The wing's curvature lifts the snow and "wings" it off the plowed surface. The snow wing is often used in conjunction with the standard moldboard, where the moldboard cuts the material and feeds it onto the wing. V-plows are mounted in front of the motor grader and are designed to dig into and lift packed snow.

The typical speed range for snow removal is 10-30 km/h (6 to 18 mph), corresponding to a gear range of 3 to 7. Snow plowing often involves lower speeds than snow removal. The typical operating range for snow plowing is 8-19 km/h (5 to 12 mph) gears 2 through 4. The majority of Snow Removal/Plowing operations are performed by the Governmental, Mining, and Forestry industries.

*Measured from mounting face on frame.
Applies to 12H, 140H and 143H. Penetration force for 160H and 163H is 8518 kg **(18,780 lb).
***12H std. tire is 13.00-24.
†Available on Standard and ES Versions only.
NOTE: See Section 1 for Ripper Tips.
◄This value may vary slightly with various vehicle configurations.

PRODUCTION

The motor grader is used in a variety of applications in a variety of industries. Therefore, there are many ways to measure its operating capacity, or production. One method expresses a motor grader's production in relation to the area covered by the moldboard.

Formula:

$$A = S \times (L_e - L_o) \times 1000 \times E \quad \text{(Metric)}$$
$$A = S \times (L_e - L_o) \times 5280 \times E \quad \text{(English)}$$

where A: Hourly operating area (m^2/h or ft^2/h)
S: Operating speed (km/h or mph)
L_e: Effective blade length (m or ft)
L_o: Width of overlap (m or ft)
E: Job efficiency

Operating Speeds:

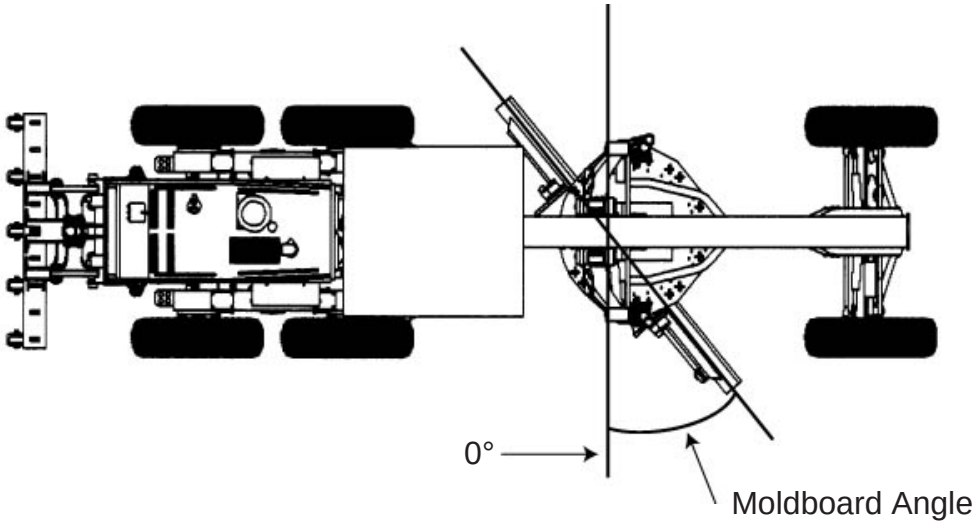
Typical operating speeds by application

Finish Grading:	0-4 km/h	(0-2.5 mph)
Heavy Blading:	0-9 km/h	(0-6 mph)
Ditch Repair:	0-5 km/h	(0-3 mph)
Ripping:	0-5 km/h	(0-3 mph)
Road Maintenance:	5-16 km/h	(3-9.5 mph)
Haul Road Maintenance:	5-16 km/h	(3-9.5 mph)
Snow Plowing:	7-21 km/h	(4-13 mph)
Snow Winging:	15-28 km/h	(9-17 mph)

Effective Blade Length:

Since the moldboard is usually angled when moving material, an effective blade length must be computed to account for this angle. This is the actual width of material swept by the moldboard.

Note: Angles are measured as shown below. The effective length becomes shorter as the angle increases.



Moldboard Length, m (ft)	Effective Length, m (ft) 30 degree blade angle	Effective Length, m (ft) 45 degree blade angle
3.658 (12)	3.17 (10.4)	2.59 (8.5)
3.962 (13)	3.43 (11.3)	2.80 (9.2)
4.267 (14)	3.70 (12.1)	3.02 (9.9)
4.877 (16)	4.22 (13.9)	3.45 (11.3)
7.315 (24)	6.33 (20.8)	5.17 (17.0)

For other blade lengths and carry angles:
Effective length = Blade length × SIN (angle)

Width of Overlap:

The width of overlap is generally 0.6 m (2.0 ft). This overlap accounts for the need to keep the tires out of the windrow on the return pass.

Job Efficiency:

Job efficiencies vary based on job conditions, operator skill, etc.

A good estimation for efficiency is approximately 0.70 to 0.85, but actual operating conditions should be used to determine the best value.

Example problem:

A 140H motor grader with a 3.66 m (12 ft) moldboard is performing road maintenance on a township road. The machine is working at an average speed of 13 km/h (8 mph) with a moldboard carry angle of 60 degrees. What is the motor grader's production based on coverage area?

Note: Due to the long passes involved in road maintenance — fewer turnarounds — a higher job efficiency of 0.90 is chosen.

Solution:

From the table, the effective blade length is 3.17 m (10.4 ft).

Metric

Production, A = 13 km/h × (3.17 m − 0.6 m) × 1000 × 0.90
= **30 069 m²/hr (3.07 hectares/hr)**

English

Production, A = 8 mph × (10.4 ft − 2.0 ft) × 5280 × 0.90
= **319,334 ft²/hr (7.33 acres/hr)**

NOTE: The formulas in the "Moderate — Cat 16H" column are the same formulas needed for the "Difficult — Cat 16H," "Moderate — Cat 24H" and "Difficult — Cat 24H" columns.

Input the data from this spreadsheet exactly how you see it here. This will allow you to generate figure 1. If you have any questions or difficulties please contact the Motor Grader Marketing Group at 217-475-4638. If you can receive e-mails Motor Grader Marketing will e-mail you the file containing the spreadsheet.

BLADE PULL

This specification is also known as drawbar pull. This spec can be calculated as follows:

Variables:

Rear weight of machine = Wr

Tire traction coefficient = T (Section 29, look up the table entitled "Coefficient of Traction Factors"

Wr × T = Blade Pull

Example problem:

Calculate the blade pull for a 140H NA version machine operating in a quarry pit...

RW = 10,501 kg

T = .65

10,501 × 0.65 = 6,825.65

BLADE DOWN PRESSURE

This spec can be calculated as follows:

Variables:

Blade to front axle length = BA

Wheel base length = WB

Weight on front wheels = FW

Blade down pressure = BD

[WB/(WB-BA)] × FW = BD

Example problem:

Calculate the blade down pressure for a 140H NA version machine...

BA = 2565 mm

WB = 6086 mm

FW = 4223 kg

BD = ?

[6086/(6086-2565)] × 4223 = 7,299 kg

This specification is only a minor indicator of a motor grader's productivity. It alone gives no measure of overall machine productivity. When considering motor grader production you need an optimum balance between the machine's front and rear weights. If a machine has too much weight on the front axle it might have a high blade down pressure spec, however it will lack the essential rear weight and traction needed to push through the load. Too much weight in the rear and it will not have the necessary weight in the front during heavy cuts to maintain proper steering control.

Caterpillar machines are built with this optimum balance in mind. A Cat motor grader is engineered with the proper weight distribution necessary for maximum productivity.

Effective Blade Length*

		Moldboard (ft)			
		12'	**14'**	**16'**	**24'**
Angle°	**0°**	12.00	14.00	16.00	24.00
	5°	11.95	13.95	15.94	23.91
	10°	11.82	13.79	15.76	23.64
	15°	11.59	13.52	15.45	23.18
	20°	11.28	13.16	15.04	22.55
	25°	10.88	12.69	14.50	21.75
	30°	10.39	12.12	13.86	20.78
	35°	9.83	11.47	13.11	19.66
	40°	9.19	10.72	12.26	18.39
	45°	8.49	9.90	11.31	16.97

*Effective blade length is the amount of blade coverage the machine is capable of when the blade is at a given angle.

This list is not all inclusive. Contact your Caterpillar Dealer for special attachment needs.

NOTE: Attachments for Cat H-Series Motor Graders require additional hydraulics. All front-mounted attachments require a Quick Attach-Detach Parallel Lift Group. Contact your Caterpillar Dealer for details.

Notes —

SKID STEER LOADERS

CONTENTS

Features:

- **Caterpillar 3034 engine** provides high horsepower and torque. Closed circuit breather, glow-plug starting aid, ecology drain and SOS oil sampling ports standard.
- **Ergonomically designed cab** provides maximum operator comfort & visibility.
- **Low-effort,** pilot hydraulic joystick controls, armrest & retractable seat belt for easy operation.
- **Deep skid resistant steps** and two tilt cylinders makes egress/ingress easy.
- **Hand and foot throttle** for continuous or variable engine speed.
- **Exclusive anti-stall feature** provides maximum rimpull and hydraulic power while lugging the engine.
- **High hydraulic horsepower** gets work done quickly.
- **Direct drive hystat pumps** eliminate universal joints and belts.
- **Tilt-up cooling package** provides access to engine compartment.
- **Long life coolant** and extended hour service intervals for low operating costs.
- **Single engine belt** drives 55 ampere alternator and water pump.
- **Deutsch connectors** are color coded, numbered and protected with nylon braiding.
- **Electro-depositioned** or "E" coat corrosion protection for long life.

Features:

- **Cat XT hose and O-ring face seals** are used throughout for superior leak-free performance.
- **Both standard and tree bits are available in a variety of sizes** for a wide range of projects.
- **Standard bit teeth and pilot points** are produced from hardened steel. Optional hardfaced and carbide inserted versions are also available.
- **Optional bit extension is available** in 305 mm (12") length.
- **Hex-to-round shaft adapter is available** to accommodate existing round auger bit mountings.
- **A13 and A19** are compatible with both mini hydraulic excavators and skid steer loaders.

A13 Auger

- **Chain reduction drive system** transfers power from the drive motor to the drive shaft, reducing motor speed and increasing torque.
- **Drive and driven sprockets are keyed** to both shafts for overload protection and easy servicing.
- **Durable continuous roller drive chain** transmits power from the drive sprocket to the driven sprocket.
- **Chain tension** is controlled with an adjustment cam.

A19 Auger

- **Planetary reduction drive system** transfers power from the drive motor to the drive shaft, reducing motor speed and increasing torque.
- **Drive motor shaft** is splined and couples directly to the planetary gearbox.

Market Opportunities

- **Agriculture** — Augers are an effective work tool around the farm to drill holes for fence posts, pole barn supports and footers for outbuildings.
- **Building/General Construction** — Augers are an essential work tool on many construction sites to drill holes for deck posts and footings, signs and fencing.
- **Landscaping/Landscape Maintenance** — Augers with special tree bits are ideal for preparing holes for tree planting. They are also ideal for school, park, golf course and recreational maintenance departments to drill holes for playground supports, trees and shrubs, fence posts, and signs.
- **Governmental/Municipalities** — Augers with multiple bit sizes are popular work tools to do a wide spectrum of jobs, including digging holes for traffic signs, poles, posts and trees.
- **Rental** — Augers are one of the highest opportunity rental work tool after buckets.
- **Specialty Trades/Utility** — Augers are ideal for electrical, fencing and plumbing contractors when installing lighting, fence posts and gas/water mains.

Augers are typically not a full time work tool, however they are a highly utilized option for specialized applications. They are often used in conjunction with a bucket, set of pallet forks and/or a trencher.

Auger Bits

Auger bits are available in both standard and tree bit configurations with standard hardened, reversible teeth and cast/hardened pilot point. Optional hardfaced and carbide inserted teeth and pilot points are available for aggressive boring conditions. Standard bits are available diameters ranging from 6"–36"; tree bits are available in 24" and 36" diameters. Typical digging depth is 48", however for deeper holes, optional 12" extensions are available. A special HEX to round adapter is also available for customers who use existing round shaft auger bits.

Machine Compatibility

The following are the recommended and approved Caterpillar machine/Auger combinations for maximum system performance.

Features:

- **Two sizes available:** the 305 mm (12") maximum drum width PC3 and the 406 mm (16") maximum drum width PC4. Both units efficiently utilize the standard flow auxiliary hydraulic horsepower capabilities of Cat Skid Steer Loaders.
- **Direct drive system** transmits power directly from the drive motor shaft to the planing drum.
- **Four pivoting skids** on the planer housing provide a stable platform when planing.
- **Optimal drum bit pattern and standard all purpose conical bits** provide maximum cutting performance and efficiency.
- **Hydraulic side shift** is standard, allowing planing as close as 76 mm (3") to curbs, walls and other obstructions.
- **Tilt and depth functions** help ensure precision beveling and pavement removal.
- **Cat XT hose and O-ring face seals** are used throughout for superior leak-free performance.
- **Optional drum widths and concrete bits** are available for specialty planing jobs.
- **Optional water sprinkler kit** is available for dust suppression.

Conical Bits: Cold planer drums are designed with an optimal bit pattern to provide maximum cutting performance and efficiency, while ensuring superior surface texture. Standard all-purpose tungsten carbide inserted conical bits provide all-purpose planing in most applications. Special concrete bits are also available for aggressive applications.

Market Opportunities

- **Infrastructure/Heavy Construction** — Skid steer mounted cold planers are frequently used on bridges to remove pavement where large dedicated planers are restricted due to weight.
- **Concrete/Masonry (Including Asphalt/Paving)** — Cold planers are used extensively by paving contractors in urban and rural settings to remove damaged pavement prior to overlay, remove excess pavement, proved specific surface texture (skid resistance), remove traffic lane stripes and re-establish proper draining characteristics of pavement.
- **Governmental/Municipalities (Street and Road Maintenance)** — Cold planers are ideal for urban road and parking lot maintenance departments to remove cracked or deteriorated pavement, milling bumps or imperfections in expanded pavement.

Cold planers are highly utilized work tools for specialized applications. They are often used in conjunction with a bucket and broom.

Machine Compatibility

The following are the recommended and approved Caterpillar machine/Cold Planer combinations for maximum system performance.

Cold Planer Model	Machine Model(s)
PC3	216, 226, 236, 246
PC4	226, 236, 246

		PC3		PC4

	Maximum depth of cut	127 mm	**5"**	127 mm	**5"**
	Cut diameter	470 mm	**18.5"**	470 mm	**18.5"**
	Tilt angle range	**±19°**		**±19°**	
	Side shift travel	559 mm	**22"**	559 mm	**22"**

Features:

- **Two sizes available:** the 1321 mm (52") working width LT13 and the 1854 mm (73") working width LT18. Both units efficiently utilize the standard flow auxiliary hydraulic horsepower capabilities of Cat Skid Steer Loaders.
- **Direct drive system** features two in-line motors that transmit power directly from the drive motor shaft to the tiller shaft. Power to both ends of the shaft eliminates torque twist and increased system performance.
- **Adjustable skid shoes** provide a working depth range of 25-152 mm (1"-6").
- **High strength medium carbon alloy steel tines** are hardened for maximum strength, durability and wear life in the toughest soil conditions.
- **Cat XT hose and O-ring face seals** are used throughout for superior leak-free performance.

Market Opportunities

- **Agriculture** — Landscape tillers provide an effective work tool around the farm or orchard to breakup and condition soil prior to planting.
- **Building/General Construction** — Landscape tillers can be used on construction sites to level soil and remove ruts.
- **Landscaping/Landscape Maintenance** — Landscape tillers are ideal for mixing and composting soils for improved seedbeds, soil stabilization and soil preparation prior to landscaping and laying sod.
- **Governmental/Municipalities** — Landscape tillers are ideal for city maintenance departments and parks to recondition, level and stabilize soil after utility work or prior to yearly landscaping.

Landscape tillers are productive work tools for specialized applications. They are often used in conjunction with a bucket, landscape rake and auger.

Machine Compatibility

The following are the recommended and approved Caterpillar machine/Landscape Tiller combinations for maximum system performance.

Landscape Tiller Model	Machine Model(s)

	Hydraulic hose	**Cat XT-3 ES**		**Cat XT-3 ES**	
	Number of tines	**24**		**36**	

Features:

- **Two sizes available:** the 1321 mm (62") working width LR15 and the 1880 mm (74") working width LR18. Both units efficiently utilize the standard flow auxiliary hydraulic horsepower capabilities of Cat Skid Steer Loaders.
- **Chain reduction drive system** features #80H roller chain for strength and durability, a variable speed unidirectional gerotor motor for maximum performance and cartridge relief valve for system protection.
- **Durable #2060H conveyor chain** provides strength, durability and long life in a variety of soil conditions.
- **High strength medium carbon alloy steel teeth** are hardened for maximum strength, durability and wear life in the toughest soil conditions.
- **Quick dumping capability** is accomplished with a poppet check valve. Once the hopper bucket is full, simply reverse flow to actuate the rake head and dump the bucket.
- **Cat XT hose and O-ring face seals** are used throughout for superior leak-free performance.

Market Opportunities

- **Agriculture** — Landscape rakes provide an effective work tool around the farm or nursery to condition, level and remove rock and foreign material from soil prior to planting.
- **Building/General Construction** — Landscape rakes can be used on construction sites to level and remove debris from soil prior to landscaping and seeding.
- **Demolition** — Landscape rakes provide an excellent means to clean up loose material after the demolition work is complete.
- **Landscaping/Landscape Maintenance** — Landscape rakes are ideal for aerating, conditioning, leveling and removing rocks from soil prior to seeding or laying sod. They also are ideal for conditioning and cleaning baseball fields.

Landscape rakes are productive work tools for specialized applications. They are often used in conjunction with a bucket, landscape tiller and auger.

Machine Compatibility

The following are the recommended and approved Caterpillar machine/Landscape Rake combinations for maximum system performance.

Landscape Rake Model	Machine Model(s)*
LR15	216, 226, 236, 246
LR18	236, 246

*Lift restriction! Do not raise liftarm — work tool hinge higher than 1 m **(3 ft)** above the ground. Tipping can result.

Features:

- **Direct drive system** provides maximum performance and durability. A variable speed, bi-directional motor is matched to the Cat Skid Steer Loader's standard flow auxiliary hydraulic circuit for excellent torque output.
- **Durable double standard anti-backflex chain** is standard for strength, durability and long life in all soil types.
- **1219 mm (48") boom and 152 mm (6") cutting width** is standard for all-purpose performance.
- **Hard faced, medium carbon alloy steel teeth** deliver long life in the toughest soil conditions.
- **Hydraulic or manual sideshift options** are available for close trenching flexibility near foundations and other structures.
- **Optional cutting widths and crumber bar** are available for wider trenching requirements and loose material removal.
- **Cat XT hose and O-ring face seals** are used throughout for superior leak-free performance.

Market Opportunities

- **Agriculture** — Trenchers provide an effective work tool around the farm or nursery to cut trenches for water lines, electrical cables and other utilities.
- **Building/General Construction** — Trenchers are often used on construction sites to cut trenches for plumbing, electrical, telephone and cable television lines.
- **Landscaping/Landscape Maintenance** — Trenchers are popular landscaping work tools when installing irrigation and water sprinkler systems. They can also be used to remove roots that grow too close to buildings or cart paths. Landscapers, golf course maintenance departments and irrigation contractors are prime users.
- **Specialty Trades/Utilities** — Trenchers are excellent work tools for specialty trades and utility contractors that need to bury water and gas pipe, conduit, electrical, telephone and cable television lines.

Trenchers are productive work tools for specialized applications. They are often used in conjunction with a bucket and auger.

Machine Compatibility

The following are the recommended and approved Caterpillar machine/Trencher combinations for maximum system performance.

	Number of teeth (every other station)	**15**	

*Equipped with standard boom, hydraulic side shift control, double standard anti-backflex chain, 254 mm **(10")** cutting width and standard hard-faced teeth.
**Cat two braid medium pressure hose is used on optional hydraulic sideshift circuit only.

Features:

- **Two sizes available:** the 1676 mm (66") drum width CV16 and the 1854 mm (73") drum width CV18. Both units efficiently utilize the standard flow auxiliary hydraulic horsepower capabilities of Cat Skid Steer Loaders.
- **Direct drive system** uses a variable speed bi-directional gear motor that drives an eccentric weighted shaft, resulting in drum vibration.
- **Durable high strength steel drums** are roll formed and butt welded for long life.
- **A spring-loaded scraper bar** is standard to prevent material buildup on the drum.
- **Oscillating tilt** is capable from a pivoting interface that allows + 15 degrees of oscillation to follow ground contour.
- **Cat XT hose and O-ring face seals** are used throughout for superior leak-free performance.

Market Opportunities

- **Building/General Construction** — Vibratory compactors can be used on construction sites to level and compact soil around building foundations after backfilling.
- **Governmental/Municipalities (Street and Road Maintenance)** — Vibratory compactors are useful work tools for compacting soil and crushed rock prior to paving or pouring concrete. They are also useful for compacting small areas of asphalt (pothole repair).
- **Landscaping/Landscape Maintenance** — Vibratory compactors are used by landscaping contractors after installing irrigation and water sprinkler systems. Golf course maintenance departments will often use this product to compact greens and fairways.
- **Paving** — Vibratory compactors are used by paving contractors for smaller paving jobs (compacting soil and crushed stone), compacting hot patch (pot hole repair) or compacting material in tight areas where a dedicated roller can't maneuver.
- **Specialty Trades/Utilities** — Vibratory compactors are ideal for compacting back-filled soil after trenching and backhoe work.

Vibratory compactors are productive work tools for specialized applications. They are often used in conjunction with a bucket, cold planer and trencher.

Machine Compatibility

The following are the recommended and approved Caterpillar machine/Vibratory Compactor combinations for maximum system performance.

Features:

- **Sweeping Widths:** Choose the 1524 mm (60") BP15, the 1829 mm (72") BP18 pickup brooms or the 2134 mm (84") BA18 angle broom. All units efficiently utilize the standard flow auxiliary hydraulic horsepower capabilities of Cat Skid Steer Loaders.
- **Direct drive system** provides maximum performance and durability. The BP15 and BA18 use a single variable speed unidirectional motor that drives the brush core; the BP18 uses two inline motors.
- **Durable polypropylene/steel wire brush sections** are standard and provide tough cleaning action on most paved surfaces.
- **Manual or hydraulic angling** is available on BA18 for quick angle changes up to 30° right or left of center.
- **A large integrated hopper bucket on BP15 and BP18** provides ample capacity for collected dirt and debris. Caterpillar bolt on cutting edges are standard for long wear life.
- **Optional gutter brush for BP15 and BP18** are available to assist in removing material from gutters.
- **Optional water sprinkler kit** available for dust suppression.
- **Optional brush types** are available for various surface types.
- **Cat XT hose and O-ring face seals** are used throughout for superior leak-free performance.

Market Opportunities

- **Building/General Construction** — Brooms are often found on construction sites once the construction is complete to remove and collect dirt, rock and other construction debris from driveways, sidewalks and streets.
- **Demolition** — Brooms are ideal for collecting loose dirt and debris from demolition sites.
- **Governmental/Municipalities (Street and Road Maintenance)** — Brooms are useful work tools for cleaning city streets, sidewalks and parking areas. Airport maintenance is another popular application.
- **Industrial/Recycling** — Pickup brooms are excellent for cleaning factory floors or industrial pavements.
- **Landscaping/Landscape Maintenance** — Brooms are used by landscaping contractors to clean paved surfaces after the landscaping is complete. Golf course maintenance departments will often use this product to clean cart paths, parking lots and even turf.
- **Paving** — Pickup brooms are often used by paving contractors to sweep and collect milled asphalt and concrete. Angle brooms are used to clean milled surfaces.
- **Specialty Trades/Utilities** — Brooms are often utilized by specialty trades and utility contractors to clean up after trenching and backhoe work.

Pickup brooms are productive work tools for specialized applications. They are often used in conjunction with a bucket, cold planer and trencher.

SHIPPING DIMENSIONS KEYS

301.5 through 375

A	Cab height
B	House width, without mirrors
C	Track width, standard shoe
D	Ground clearance, frame
E	Ground clearance, counterweight
F	Tail swing radius
G	Overall track length (grouser bar to grouser bar)
H	Overall transport length
J	Shipping height
K	Length of track on ground
L	Track gauge

M312 through M320

A	Cab height
B	Transport width
C	Overall tire width
D	Ground clearance, frame
E	House height
F	Exhaust stack height
G	Overall length (outrigger to outrigger)
H	Overall transport length
J	Transport height
K	Ground clearance, counterweight
L	Transport length without boom
M	Cab swing radius
N	Tail swing radius
O	Wheelbase length
P	Overall width (outrigger to outrigger)

One-Piece Boom
Digging Envelope

- Standard shoes and undercarriage
- Lug height not included

KEY:

A	Maximum loading height of bucket with teeth
B	Maximum reach at ground level
C	Maximum digging depth
D	Maximum vertical wall
E	Maximum depth of cut for 2.44 m **(8'0")** level bottom (straight clean up)
F	Maximum bucket hinge pin height
G	Maximum height, to bucket teeth at highest arc

Hydraulic Adjustable Boom Digging Envelope

- Standard 10 × 20 tires and undercarriage
- General purpose bucket

KEY:

- **A** Maximum loading height of bucket with teeth
- **B** Maximum reach at ground level
- **C** Maximum digging depth
- **D** Maximum vertical wall
- **E** Maximum depth of cut for 2.44 m **(8'0")** level bottom
- **F** Maximum height, to bucket teeth at highest arc

EXCAVATOR LIFTING CAPACITY

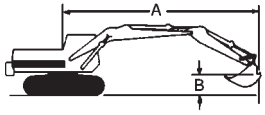
On many sewer jobs an excavator must lift and swing heavy pipe and manboxes in and out of the trench, place manholes and unload material from trucks. In some situations the excavator's lift requirements may be so critical that they determine the size excavator selected.

An excavator's lift capacity depends on its weight, center of gravity, the lift point position (see sketches) and its hydraulic capability. An excavator's lifting capability for any given lift position is limited by its tipping stability or hydraulic capacity.

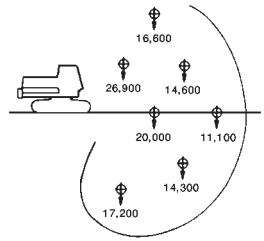
Changes in boom, stick and bucket position affect attachment geometry and can drastically change a machine's hydraulic lifting capacity. Caterpillar defines excavator lifting capabilities using the following SAE guidelines.

Tipping Conditions — An excavator is considered to be at the tipping point when the weight in the bucket acting at the center of gravity causes the rear rollers to lift clear of the track rails. Suspended loads are considered to be hung from the back of the excavator's bucket or bucket linkage by a sling or chain. Weights of attachments, slings or auxiliary lifting devices are considered part of the suspended load.

Thus, the tipping load is defined as the load producing a tipping condition at a specified radius. The load radius shall be measured as the horizontal distance from the axis of upper structure rotation (before loading) to the center of vertical load line with load applied (dimension A, below). The rating height is based on the vertical distance of the bucket lift point to the ground (dimension B).



A. Radius from swing centerline
B. Bucket lift point height



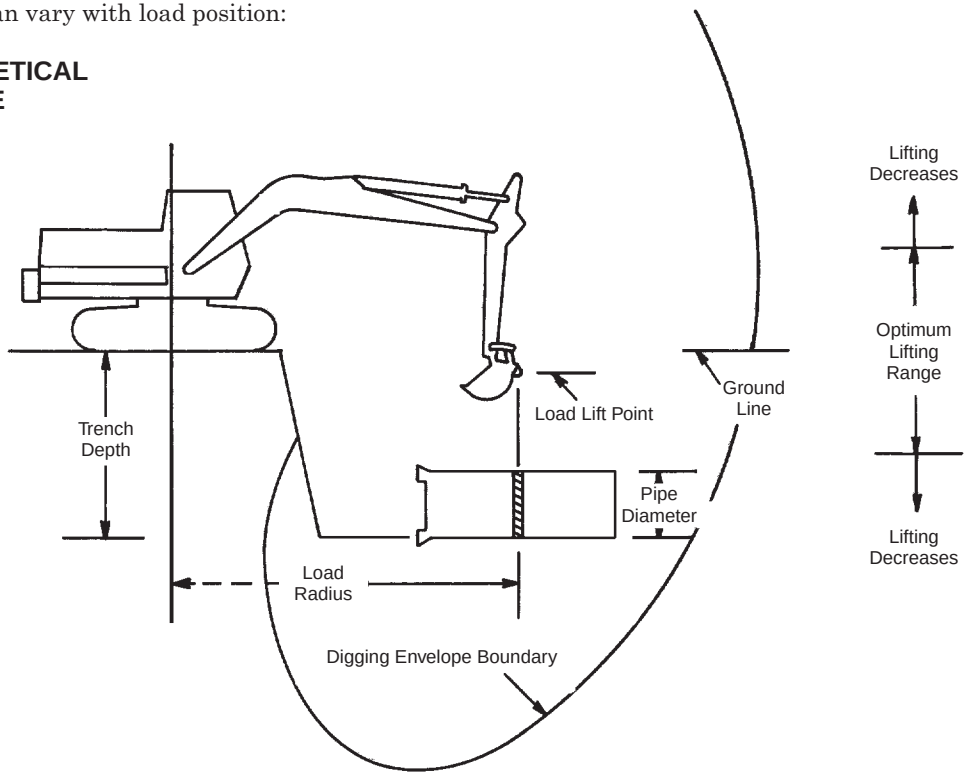
HYPOTHETICAL MACHINE

Rated Hoist Load — The rated load is established using the vertical distance of the lifting point to the ground and the radius of load. Ratings for the ability of a specific machine attachment to lift a load slung from the designated bucket are defined as follows:

a. The rated load will not exceed 75% of the tipping load.
b. The rated load will not exceed 87% of the excavator's hydraulic capacity. This means the machine should be able to lift 115% of the rated load.
c. The rated load will not exceed the machine's structural capability.

This drawing shows how an excavator's lifting capacity can vary with load position:

HYPOTHETICAL MACHINE



Tips for Lifting Above Ground:

Get the load as close to the excavator as possible.

Use a cable short enough and position the excavator so as to put the load lift point in the "optimum lifting range" (see sketch).

Problem: Long reach cable — Can't lift.

Solution: Shorten reach and cable — Can lift.

Tips for Lifting Below Grade:

Use a cable for sufficient length to position the load lift point in the "optimum lifting range".

Problem: Short cable, deep trench — Can't lift.

Solution: Lengthen cable to locate bucket hinge pin in optimum lifting area — Can lift.

GROUND LEVEL LIFTING CAPACITIES

The lifting capacities that are shown on the following pages are with the lifting point at ground level. These capacities are rated according to SAE Std. No. J1097.

(For lifting capacities at other heights or with other tools, refer to current Specification Sheets.)

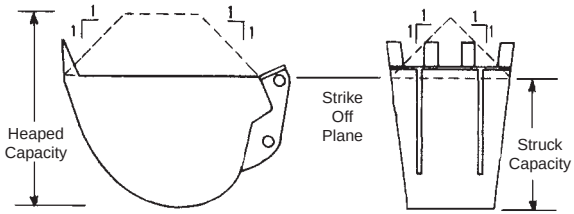
EXCAVATOR BUCKET CAPACITIES

Caterpillar rates excavator buckets to conform with both PCSA standard No. 3 and SAE standard J-296. Buckets are rated on both their struck and heaped capacities as follows:

Struck Capacity

Volume actually enclosed inside the outline of the sideplates and rear and front bucket enclosures without any consideration for any material supported or carried by the spillplate or bucket teeth.



Excavator Bucket Rating

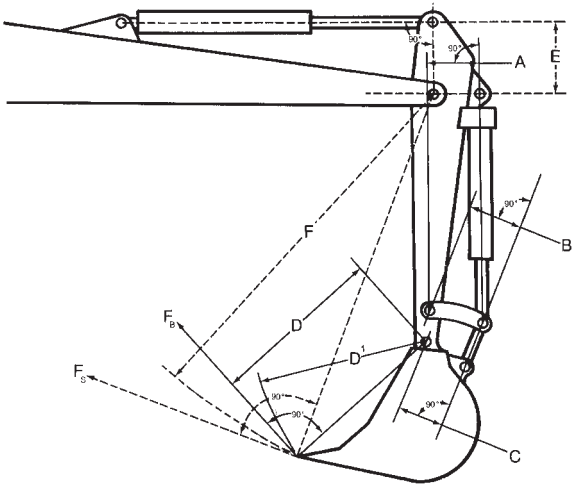
Heaped Capacity

Volume in the bucket under the strike off plane plus the volume of the heaped material above the strike off plane, having an angle of repose of 1:1 without any consideration for any material supported or carried by the spillplate or bucket teeth.

The Committee on European Construction Equipment (CECE) rates heaped bucket pay loads on a 2:1 angle of repose for material above the strike off plane.

CURL AND CROWD FORCES

Bucket penetration into a material is achieved by the bucket curling force (F_B) and stick crowd force (F_S). Rated digging forces are the digging forces that can be exerted at the outermost cutting point. These forces can be calculated by applying working relief hydraulic pressure to the cylinder(s) providing the digging force. The digging forces listed on next page conform with SAE Standard J1179 and PCSA Standard No. 3. The values may not be directly comparable to forces for machines rated by other methods than those described below.



F_B = Radial tooth force due to bucket cylinder

$$= \frac{\text{Bucket cylinder force}}{\text{Arm D length}} \left(\frac{\text{Arm A} \times \text{Arm C}}{\text{Arm B}} \right)$$

Cylinder force = (Pressure) × (End area of cylinder head)

Arm D = Bucket tip radius

Maximum radial tooth force due to bucket cylinder (bucket curling force) is the digging force generated by the bucket cylinder(s) and tangent to the arc of radius D^1. The bucket shall be positioned to obtain maximum output moment from the bucket cylinder(s) and connecting linkages. When calculating, maximum F_B occurs when the factor — Arm A times Arm C divided by Arm B — becomes the maximum.

F_S = Radial tooth force due to stick cylinder

$$= \frac{(\text{Stick cylinder force}) \times (\text{Arm E length})}{(\text{Arm F length})}$$

Arm F = Bucket tip radius + stick length

Maximum radial tooth force due to stick cylinder (stick crowd force) is the digging force generated by the stick cylinder(s) and tangent to the arc of radius F. The stick shall be positioned to obtain the maximum output moment from the arm cylinder and the bucket positioned as described in the bucket force rating. When calculating, maximum F_S occurs when the axis in the stick cylinder working direction is at a right angle to the line connecting the stick cylinder pin and the boom nose pin.

Bucket Selection Considering Bucket Curl and Stick Crowd Forces

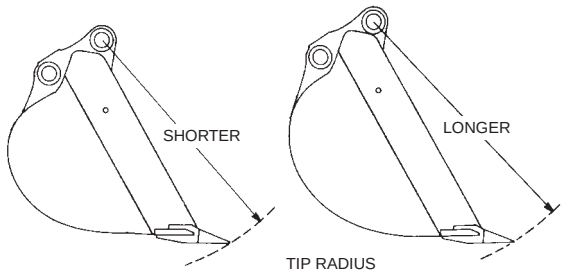
The combination of the excavator's stick crowd force and bucket curling force give this machine configuration more effective bucket penetration force per mm (inch) of bucket cutting edge than is available with other machine types such as wheel and track loaders.

As a result of high penetration force, an excavator bucket is comparatively easy to load. Also, the higher unit breakout forces allow the excavator's economic application range to be extended farther into the tougher soils (coral, caliche, shale, limestone) before blasting or ripping is required.

To take full advantage of an excavator's high penetration forces, buckets should be selected so they are well matched to soil conditions that are encountered. The two important things to consider are bucket width and bucket tip radius.

As a general rule, wide buckets are used in easily dug soil and narrow buckets in harder material. In hard rocky soils, tip radius also has to be considered in bucket selection. Because the shorter tip radius buckets provide more total bucket curling force than the long tip radius buckets, they are generally the easiest to load. A good rule of thumb when selecting a Caterpillar bucket for hard material is to choose the narrowest bucket that has a short tip radius.

Other factors such as trench bottom width specifications, manbox size, or the desire to conserve bedding material may also influence excavator bucket selection.



NOTE: See the following pages for listing of Caterpillar buckets by tip radius and cutting edge width.

*Not available in all sales areas.

Caterpillar offers a very comprehensive list of high strength steel buckets. High strength steel allows thinner components which helps keep the weight down, maintains durability and improves loadability. The wrong bucket can reduce production 30-40% or more. Caterpillar's in-depth knowledge of machine design, bucket design and application experience allows offering **machine matched** packages that optimize performance.

Additional buckets may be available and the listed buckets may not be available in all sales areas. Contact your Caterpillar Dealer for your specific bucket needs.

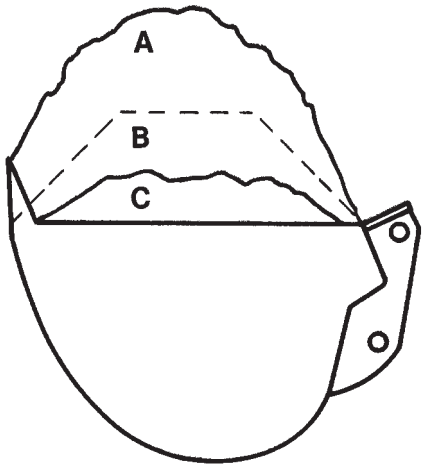
BUCKET PAYLOAD

An excavator's bucket payload (actual amount of material in the bucket on each digging cycle) is dependent on bucket size, shape, curl force, and certain soil characteristics, i.e., the fill factor for that soil. Fill factors for several types of material are listed below.

Average Bucket Payload =
(Heaped Bucket Capacity) × (Bucket Fill Factor)

Material	Fill Factor Range (Percent of heaped bucket capacity)
Moist Loam or Sandy Clay	**A** — 100-110%
Sand and Gravel	**B** — 95-110%
Hard, Tough Clay	**C** — 80-90%
Rock — Well Blasted	60-75%
Rock — Poorly Blasted	40-50%



Working Weights — Bucket & Payload

The following tables give maximum "bucket plus payload" weights to assist in selecting the correct bucket for a specific application. These weights are based on actual job conditions. In better than average conditions the excavator may be able to achieve rated lift capacities listed in this section.

NOTE: Bucket sizes are suitable for a maximum material density of 1800 kg/m^3 (3035 lb/yd^3). Payloads shown are calculated at 1500 kg/m^3 (2530 lb/yd^3).

INTRODUCTION

Long reach excavators are designed purposely for light duty digging that requires reach capability well above that of normal digging machines. To be able to have high enough digging forces together with an acceptable size bucket, the long reach excavators have a smaller digging envelope than the ditch cleaning machines. Long reach excavators are ideally suited for deep digging in gravel or sand pits then feeding directly into a hopper.

Caterpillar's long reach hydraulic excavators use purpose-built booms and sticks designed by Caterpillar for maximum performance and durability in light duty applications.

Long Reach Excavation Fronts include: boom, stick, linkage cylinders (boom, stick, and bucket), hydraulic lines, additional counterweight for stability over the side and heavy duty wide undercarriage. Dimensions include light excavation bucket.

INTRODUCTION

Ditch cleaning excavators are designed specifically for those jobs requiring maximum reach well beyond the range of normal excavators. Those machines are designed to drag a small bucket at about 90 degrees over the side of the tracks towards the excavator; they are not suited for digging work. Caterpillar offers the Long Reach excavators for light digging applications with a much larger digging envelope than normal excavators. Ditch cleaning excavators are suited for ditch cleaning, slope finishing, river conservation and other work formerly reserved to draglines.

Caterpillar's ditch cleaning hydraulic excavators use purpose-built booms and sticks designed by Caterpillar for maximum performance and durability in dragging applications.

Ditch Cleaning Fronts include: boom, stick, linkage cylinders (boom, stick, and bucket), hydraulic lines and additional counterweight for stability while working over the side. Dimensions include ditch cleaning bucket.

EXCAVATOR SELECTION: TRACKS VERSUS WHEELS

Features:

Tracks	Wheels
• Flotation	• Mobility and speed
• Traction	• No pavement damage
• Maneuverability	• Better stability with outriggers or dozers
• Severe underfoot	• Leveling machine with outriggers
• Faster machine repositioning	• Dozing capability

307–375

Unless the application calls for a lot of travel to, from, and around the job sites, a track-type excavator could be the better choice. Track-type excavators provide good traction and flotation in almost all kinds of underfoot conditions. Consistently good drawbar power provides excellent maneuverability. The tracked undercarriage also provides good overall stability. If the job calls for frequent machine repositioning, a track-type excavator will provide better operating efficiency — where raising and lowering outriggers would take extra time.

Wheels (M312 and M320)

Looking for a highly versatile machine? A machine that can do more than mass excavation and trenching. Consider a Wheel Excavator.

A Wheel Excavator combines traditional excavator features such as 360° swing, long reach, deep digging depth, high loading height, high digging forces and high lift capacities, with the mobility of a wheeled undercarriage. The rubber tires allow the excavator to travel paved roads, work in shopping malls, squares, parking lots and other paved areas without damaging the pavement. It's mobility allows fast independent travel between jobsites as well as on the jobsite giving you more job planning flexibility. The Wheel Excavator is the ideal tool for truck loading in tight quarters, undercutting concrete or asphalt, patching, shoulder work, curb and gutter repair, landscaping, spreading top soil, fine grading, laying pipe, placing manholes or ditch cleaning.

A Wheel Excavator is also an ideal machine in material handling. It can load or unload trucks and carry loads around the job site. Stabilizers and a dozer blade can be pinned to the undercarriage increasing the machines stability during lifting.

Equip the Wheel Excavator with dedicated special attachments such as cab riser, material handling stick and boom. Add the additional hydraulic circuit option and your ready for a complete range of special tools. Ditch cleaning bucket, clamshell, grapples, hammers to name a few.

Caterpillar Wheel Excavators offer a load independent, load-sensing, flow distribution hydraulic system that gives the operator absolute precision and control no matter what the application.

Machine weight is the key to selecting a Wheel Excavator. Following are some additional factors that need to be considered.

Choose the proper boom and stick for your reach, digging depth and lifting requirements. Stability can be greatly enhanced by adding outriggers and/or a dozer blade. Additional hydraulic circuits can be added depending on your application and stick end attachments.

Acceptable Bucket/Stick Combinations

The following charts identify the acceptable bucket and stick combinations for Caterpillar Wheel Excavators and are based on stability. Minimum stability occurs with the linkage oriented over the side and positioned as shown in the visual. Dozer and/or stabilizers (if equipped) are raised and the bucket contains a full load. The longest stick is shown that has acceptable stability for each bucket. That stability is 1.1 moment ratio or better. Once this stability factor is established, all shorter sticks are then acceptable with the listed bucket.

EXCAVATOR SHOE SELECTION

Undercarriage life can be extended by equipping the machine properly for the application.

Many excavators work on pavement or flat, soft ground and experience few undercarriage problems. But if those same machines (usually equipped with wide track pads) were placed in severe underfoot conditions, undercarriage destruction could occur very rapidly.

The rule, used for other track-type machines — *"Whenever possible use the narrowest shoes available" — is even more valid for excavators.*

The best general purpose track shoe is the triple grouser. It has a good section modulus and offers the best compromise between traction and minimum disturbance to paved surface.

The double grouser shoe has a better section modulus and is more aggressive than the triple grouser section. Single grouser shoes are offered for maximum traction. Some users like single grousers for added mobility in hilly terrain.

The following table lists ground pressures for various width shoes (reach boom, medium stick and bucket):

Model	Shoe Type	Shoe Width mm	Shoe Width in	Pressure kPa	Pressure psi
301.5	Steel Double Grouser	230	**9**	29.9	**4.33**
	Rubber Belt	230	**9**	28.7	**4.16**

NOTE: Belgium sourced excavators have different ground pressures. See Technical Data Sheets.

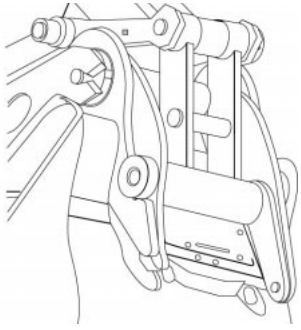
QUICK COUPLER SYSTEMS

Quick couplers can greatly increase a machine's versatility and productivity. They make it much easier to switch attachments which can increase utilization. Quick couplers also encourage changing buckets when the application changes, rather than continue to use a less efficient bucket. Example: An application that is predominately dirt with occasional pockets or seams of rock. Without a quick coupler the owner may choose to live with a rock bucket but, rock buckets are normally smaller and heavier which reduces performance in a dirt application. A quick coupler allows the use of the rock bucket in the rock and a GP bucket in the dirt.

There are two types of quick couplers. The first is a dedicated type. A typical system substitutes hooks on the bucket for the pin-on hinges used with conventional buckets. The mating portion is pinned on the stick and bucket linkage. It slips into the hooks to secure the bucket or other attachment.



Dedicated Hook-type

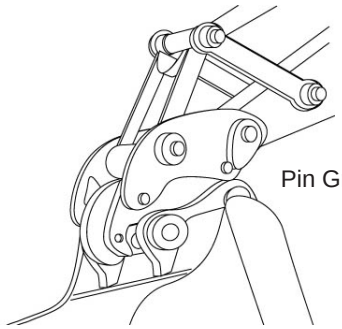
Advantages:

Bucket tip radius (distance from the bucket pivot point to the bucket tip) does not increase. Increased tip radius reduces curl and stick forces which can reduce the loadability of the bucket. The hook type coupler also does not add appreciable weight at the end of the stick. Keeping the tip radius and weight the same ensure no compromise in performance. The machine portion of the hook type coupler can be designed to allow more than one machine to use the same buckets.

Disadvantages:

The hook type system requires special buckets. Conventional pin-on buckets cannot be used. The ability to use buckets on more than one machine requires careful application analysis. Larger machines generate forces that can destroy the wrong buckets. Smaller machines with the wrong bucket may develop loads in excess of the machine's capability. Even if the machine can handle the loads, the tip radius may be too large to allow the bucket to load properly. With the flexibility of a quick coupler comes the responsibility to make sure the bucket or other attachments are properly sized for each application.

The second type of quick coupler is the pin grabber type. This device pins on the stick and bucket linkage and grabs the bucket pins on standard pin-on buckets.



Pin Grabber

Advantages:

The advantage of the pin grabber is that it will pick up standard pin-on buckets. No need to purchase new attachments that will fit the system.

Disadvantages:

The pin grabber is mounted between the stick and the bucket which increases the tip radius. The amount of increase depends on the pin grabber's manufacturer. Increasing tip radius can compromise performance by decreasing bucket forces. The coupler also adds weight and reduces the payload capability.

Pin grabbers are required to mate up with existing bucket pins. Because different machines require different pin spreads and diameters, they offer very limited ability to match with buckets from other machines.

Both types of quick couplers offer two types of actuation. Mechanical … which requires manual activity to release and engage the attachment. This process can take from one to five minutes depending on the coupler design. The other type is cab activated … this type can usually allow an attachment change in 30 seconds or less.

CYCLE TIME ESTIMATING CHARTS

The digging cycle of the excavator is composed of four segments:

1. Load Bucket
2. Swing Loaded
3. Dump Bucket
4. Swing Empty

Total excavator cycle time is dependent on machine size (small machines can cycle faster than large machines) and job conditions. With excellent job conditions the excavator can cycle fast. As job conditions become more severe (tougher digging, deeper trench, more obstacles, etc.), the excavator slows down accordingly. As the soil gets harder to dig, it takes longer to fill the bucket. As the trench gets deeper and the spoil pile larger, the bucket has to travel farther and the upper structure has to swing farther on each digging cycle.

Spoil pile or truck location also affects cycle time. If a truck is located on the floor of the excavation beside material being moved, 10 to 17 second cycles are practical. The other extreme would be a truck or spoil pile located above the excavator 180° from the excavation.

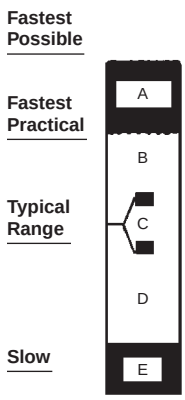
In sewer construction work the operator may not be able to work at full speed because he has to dig around existing utilities, load the bucket inside a trench shield, or avoid people working in the area.

The Cycle Time Estimating Chart outlines the range of total cycle time that can be expected as job conditions range from excellent to severe. Many variables affect how fast the excavator is able to work. The chart defines the range of cycle times frequently experienced with a machine and provides a guide to what is an “easy” or a “hard” job. The estimator can then evaluate the conditions of his job and use the Cycle Time Estimating Chart to select the appropriate working range. A practical method of further calibrating the Cycle Time Estimating Chart is to observe excavators working in the field and correlate measured cycle times to job conditions, operator ability, etc.

The following table breaks down what experience has shown to be typical Caterpillar excavator cycle times with

— no obstruction in the right of way
— above average job conditions
— an operator of average ability and
— 60°-90° swing angle.

These times would decrease as job conditions or operator ability improved and would get slower as conditions become less favorable.



KEY

A — Excellent
B — Above Average
C — Average
D — Below Average
E — Severe

CYCLE TIME -vs- JOB CONDITION DESCRIPTION

— Easy digging (unpacked earth, sand gravel, ditch cleaning, etc.). Digging to less than 40% of machine’s maximum depth capability. Swing angle less than 30°. Dump onto spoil pile or truck in excavation. No obstructions. Good operator.

— Medium digging (packed earth, tough dry clay, soil with less than 25% rock content). Depth to 50% of machine’s maximum capability. Swing angle to 60°. Large dump target. Few obstructions.

— Medium to hard digging (hard packed soil with up to 50% rock content). Depth to 70% of machine’s maximum capability. Swing angle to 90°. Loading trucks with truck spotted close to excavator.

— Hard digging (shot rock or tough soil with up to 75% rock content). Depth to 90% of machine’s maximum capability. Swing angle to 120°. Shored trench. Small dump target. Working over pipe crew.

— Toughest digging (sandstone, caliche, shale, certain limestones, hard frost). Over 90% of machine’s maximum depth capability. Swing over 120°. Loading bucket in man box. Dump into small target requiring maximum excavator reach. People and obstructions in the work area.

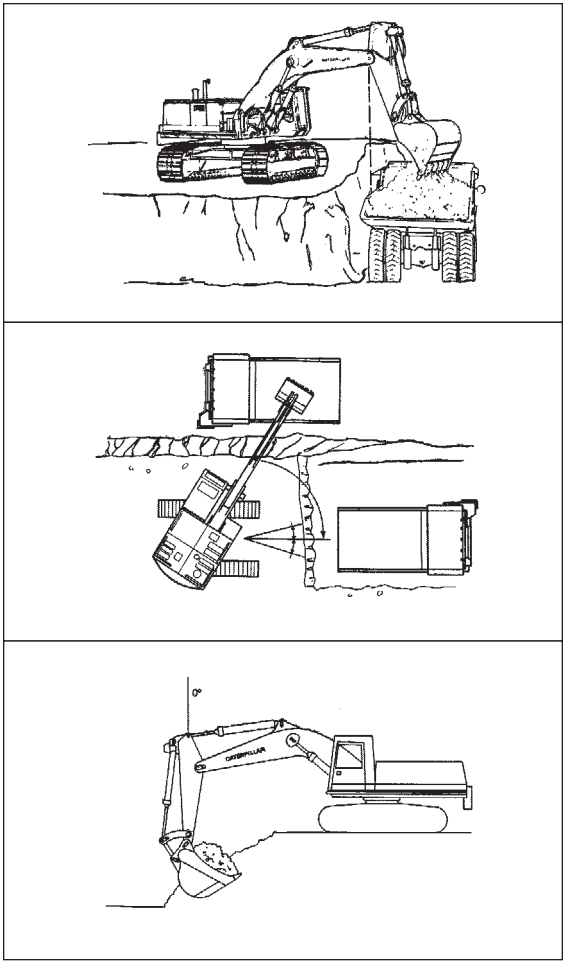
Caterpillar 300 Series Mass Excavation booms and buckets coupled with the proper stick will help you move material faster and more efficiently in production excavation and loading applications. With the largest bucket, shortest stick and long undercarriage your excavator can often do the work of a larger machine. A longer stick and standard undercarriage make it ideal for loading on-highway trucks and general construction jobs.

MAXIMIZING PRODUCTION WITH A MASS EXCAVATOR



Ideal Bench Height and Truck Distance — For stable or consolidated materials, bench height should be about equal to stick length. For unstable materials it should be less. The most useful truck position is when the inside truck body rail is below the boomstick hinge pin.

Optimum Work Zone and Swing Angle — For maximum production, the work zone should be limited to 15° either side of machine center or about equal to undercarriage width. Trucks should be positioned as close as possible to machine centerline. Two alternatives shown here.

Best Distance from the Edge — The machine should be positioned so that the stick is vertical when the bucket reaches full load. If the unit is farther back, breakout force is reduced. If it is closer to the edge, undercutting may occur and time is wasted bringing the stick back out. Also, the operator should begin boom-up when the bucket is 75% of the way through the curl cycle. This should be as the stick nears the vertical position.

This example reflects the ideal situation. Not all points are usable on each job, but incorporation of as many of these points as possible will positively affect production.

EARTHMOVING PRODUCTION

As with any other piece of material handling equipment, excavator earthmoving production is dependent on average bucket payload, average cycle time and job efficiency. If an estimator can accurately predict excavator cycle time and bucket payload, a machine's earthmoving production can be derived from the following formula.

m^3 (yd^3)/60 min hr = Cycles/60 min hr × Avg. Bucket Payload in m^3 (yd^3)

$$m^3 (yd^3)/60 \text{ min hr} = \frac{60 \text{ min/hr}}{\text{Cycle Time} - \text{min}} \times \text{Avg. Bucket Payload in } m^3 (yd^3)$$

Avg. Bucket Payload = Heaped Bucket Capacity × Bucket Fill Factor

Actual m^3 (yd^3)/hr = m^3 (yd^3)/60 min hr × Job Efficiency Factor

The Production Estimating Tables (next page) will provide theoretical earthmoving production in cubic meters (yards) per hour if bucket size and cycle time can be estimated. The use of an average cycle time allows adjusting the estimated production for specific job sites and applications. For instance, estimating truck loading applications should include truck exchange times which extends the average cycle time and reduces production potential. The values in the table are based on a 60 minute work hour or 100% efficiency (a condition that is never achieved in reality). The estimator should apply a job efficiency factor to the figures in the table based on his judgment or knowledge of actual job conditions.

Areas outlined on the Production Estimating Table define the work ranges of excavators in the size classes of Caterpillar 307 through 5230 ME Excavators. The upper limit on each area corresponds to the "fastest practical" cycle time for the machines. The width of each area corresponds to the range of bucket payload sizes the machine can handle. An unshaded box has been provided in each machine area to provide a guide indicating that the upper limit of earthmoving production is being approached. When working beyond the values in the white area, the estimator should be certain that excellent job conditions will be encountered (easy digging, shallow trench, good operator, etc.).

The Production Estimating Table can also serve as a guide when selecting the proper size machine to do a job, as is shown in the following example.

Example problem (Metric)

Contractor has a job to move 15 300 Bm^3 (19 100 Lm^3 considering 25% swell factor) of wet sandy loam material in rear dump on-highway trucks which will be loaded by an excavator. Average face depth will be 2.4 m with 60-90 degree average swing angle. Ten days are available to do the work. Contractor plans to work 10 hrs/day and estimates a 50 min. work hour (83% job efficiency). He has two excavators that could be made available to do the work — a 320 with 1.0 m^3 bucket or a 330 with 1.9 m^3 bucket. Experience has shown that either machine can get its rated capacity in the sandy loam soil. Could this job be done with either machine or will the 330 have to be used?

Solution: The excavator must produce 1900 Lm^3/Day (19 100 Lm^3 ÷ 10 Days) which means the required average hourly rate will be 190 Lm^3/60 Min. Hr. (1900 Lm^3/Day ÷ 10 hrs/day). Further considering the 83% job efficiency, the excavator's capability will have to be 230 Lm^3/50 min hr.

The production estimating table shows that the 320 with a 1.0 m^3 bucket would have to achieve a 17.1 sec. average cycle time to produce the required 190 Lm^3/60 min. hr. With job efficiency applied a 15.0 second average cycle time is required to produce the 230 Lm^3/50 min. hr. The 330 with a 1.9 m^3 bucket could obtain the same 60 min. hr. production level with a 35 second average cycle, or 30 second cycles to meet the 50 min. hr. production requirement. The cycle times estimating chart shows that the 320 would be working near its maximum capability to meet the production requirement, whereas, the 330 could handle the job easily. This information can then be weighed against what else is known about the job (reach requirements, job conditions, operator ability, etc.) to decide whether or not the larger machine is needed.

Example problem (English)

Substitute these English values in the preceding problem:

Job — 20,000 BCY (25,000 LCY considering 25% swell).

Average face depth — 8-12 ft

320 L with 1.25 yd^3 bucket or 330 with 2.5 yd^3 bucket.

Solution: The excavator must produce 2500 LCY/Day, which means the required average hourly rate will be 250 LCY/60 min hr. Further considering the 83% job efficiency the excavator's capability will have to be 300 LCY/50 min hr.

The same concluding comments regarding the Production Estimating Table apply here as in the Metric example.

EXCAVATOR TRENCHING PRODUCTION

When an excavator is used for trenching applications, a meaningful expression of work produced is the machine's trenching rate expressed in meters or lineal feet per hour or per day. Trenching rate depends on the earthmoving production of the excavator being used and the size of the trench being excavated. Earthmoving production converts to trenching production as follows:

$$\text{Lineal Meters of Trench per Hour} = \frac{\text{Cubic Meters Excavated per Hour}}{\text{Cubic Meters per Lineal Meter of Trench}}$$

$$\text{Lineal Meters of Trench per day} = (\text{Lineal Meters per Hour}) \times (\text{Trenching Hours per Day})$$

$$\text{Lineal Feet of Trench per Hour} = \frac{\text{Yd}^3 \text{ Excavated Per Hour}}{\text{Yd}^3 \text{ Per Lineal Foot of Trench}}$$

$$\text{Lineal Feet of Trench Per Day} = (\text{Lineal Ft Per Hour}) \times (\text{Trenching Hours Per Day})$$

For machines that work in trenching applications where they dig all of the time, the *Trenching Conversion Chart* provides easy conversion from m^3 (yd^3) per hour to m (lineal feet) per hour, if the excavating rate m^3/hr (yd^3/hr) and trench volume m^3/m (yd^3/ft) are known. The following examples demonstrate how the Trenching Conversion Chart can be used.

Example problem (Metric)

Contractor estimates that the 325 Excavator will produce 200 Lm^3/hour. Trench survey shows that the trench contains 2.5 Lm^3/meter. What trenching rate will the 325 produce?

Solution: Enter the horizontal axis of the Trenching Conversion Chart at 200 m^3/Hour and move up to the 2.5 m^3/m diagonal line. Then move left to the vertical axis of chart and read answer of 80 m/hour.

● ● ●

Example problem 2 (Metric)

Contractor knows he must produce 1000 meters of trench in every 10 hour work day. Survey shows that trench contains 1.5 Bm^3 per lineal meter and soil swell factor is estimated at 30%. How much earthmoving production will the excavator have to provide in order to get the job done on time assuming a 50 min work hour? What Caterpillar excavator will provide needed production at 6 meter maximum depth in sandy loam soil?

Solution: Determine trenching requirement 1000 meters in 10 hrs = 100 m/h. Convert Bm^3 to Lm^3 (excavator handles Lm^3) 1.5 Bm^3/m × 1.30 = 2.0 Lm^3/m. Enter vertical axis of trenching conversion chart at m/h and travel horizontally to diagonal line representing 2.0 m^3/m. Next move down to horizontal axis and read answer to 200 Lm^3/50 min hr. Convert 200 Lm^3/50 min hr to Lm^3/60 min hr = 200 = 241 Lm^3/60 min hr.

Production estimating tables in this section show that 241 Lm^3/60 min hr is within the capability of a 325 Excavator. Job should then be checked for reach and lifting requirements to make sure that the 325 could handle these aspects of the work.

● ● ●

Example problem (English)

Contractor estimates that a 325 Excavator will produce 250 LCY/Hour. Trench survey shows that the trench contains 2.5 LCY/Foot. What trenching rate will the 325 produce?

Solution: Enter the horizontal axis of the Trenching Conversion Chart at 250 yd^3/hr. Then move to the vertical axis of chart and read answer of 100 ft/hr.

The Trenching Conversion Chart can also be used to determine the required excavating rate if the contractor can define his trenching production requirement and the trench volume per lineal foot.

● ● ●

Example problem 2 (English)

Contractor knows he must produce 1000 ft of trench in every 10 hr work day. Survey shows that trench contains 1.6 BCY per lineal ft and soil swell factor is estimated at 25%. How much earthmoving production will excavator have to provide in order to get the job done on time assuming 50 min work hour? What Caterpillar model will provide needed production at 8 ft depth in sandy loam soil?

Solution: Determine trenching requirement — 1000 ft in 10 Hrs. = 100 ft/hr
Convert BCY to LCY — 1.6 BCY/ft × 1.25 = 2.0 LCY/ft

Enter vertical axis of trenching conversion chart at 100 ft/hr and travel over to diagonal line representing 2.0 yd³/ft. Next move down to horizontal axis and read answer of 200 LCY/50 min hr.

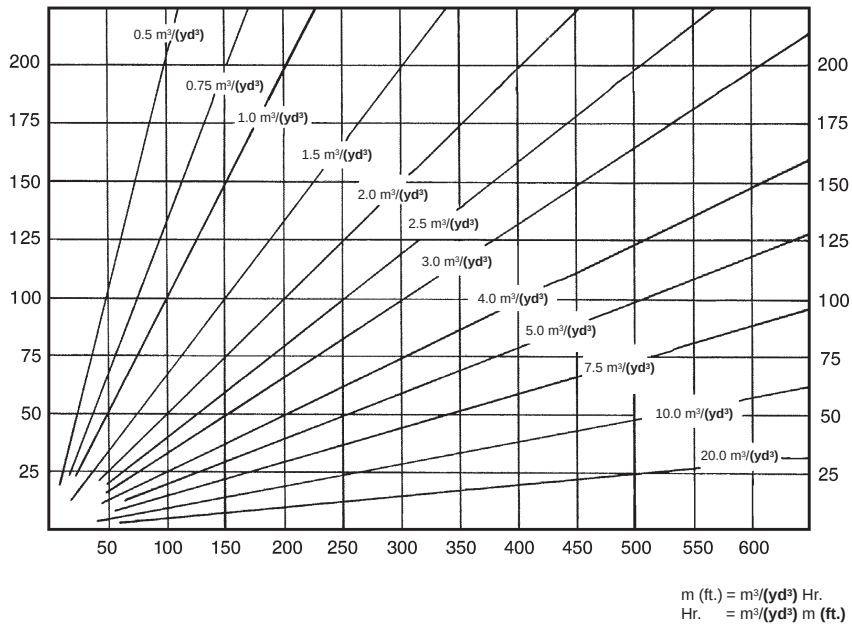
Convert 200 LCY/50 min hr to LCY/60 min hr =

$$\frac{200}{0.83} = 241 \text{ LCY/60 min hr}$$

Production estimating tables in this section show that 241 LCY/60 min. hr. is within capability of a 325 Excavator. Job should then be checked for reach and lifting requirements to make sure that the 325 could handle these aspects of the work.

● ● ●

TRENCHING CONVERSION CHART — CUBIC METERS (yd³) PER HOUR TO METER (ft) PER HOUR



m (ft.) = m³/(yd³) Hr.
Hr. = m³/(yd³) m (ft.)

Values in m³/m or yd³/ft

If excavating rate has been calculated in Bm³/h use Bm³/m for Trench Volume/m.
" " " " " " " Lm³/h use Lm³/m for Trench Volume/m.
" " " " " " " BCY/Hr use BCY/ft for Trench Volume/ft.
" " " " " " " LCY/Hr use LCY/ft for Trench Volume/ft.

Estimating Bucket Size

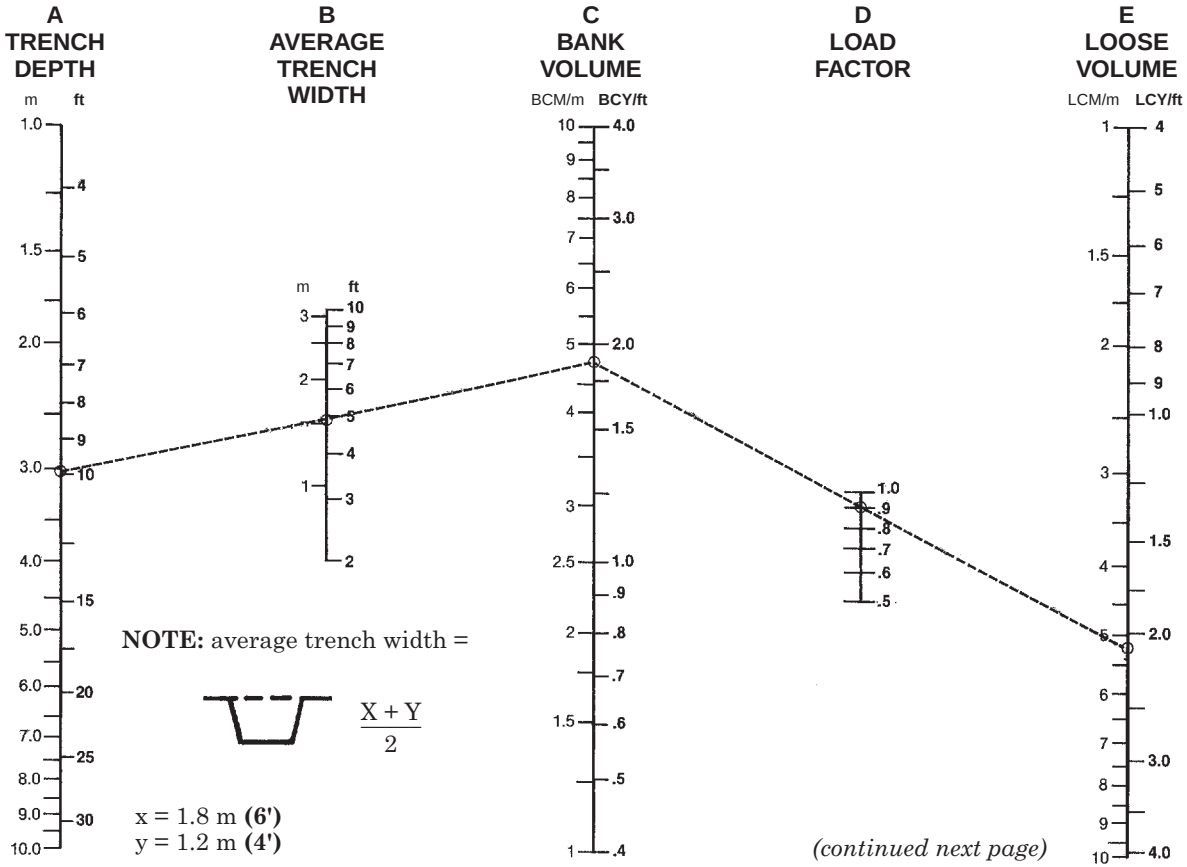
In addition to the trenching calculations on the previous pages, an alternative method of figuring trenching production is the nomograph. Shown on the following pages, this particular nomograph can be used for estimating bucket size when given trench dimensions and linear production rate. The nomograph is quicker and easier than the preceding example because it does not require as many calculations, yet the accuracy is about the same within the normal limits of input data.

Be careful when entering and reading data from the nomographs because some scales increase from bottom to top, while others are the reverse. Do not be overly concerned with the precision as affected by pencil line width or reading to the hundredth of a m^3 (yd^3). Remember that bucket fill factor, material density and cycle time are at best close estimates.

Example problem:

A sewer contractor owns a 325 with 2 piece boom and short stick. He wants to bid a contract for a 3.1 m (10') deep trench which measures 1.8 m (6') at the top and 1.2 m (4') at the bottom. He must dig 9 m/hr (30 ft/hr) to finish on time. The material is sand and gravel with a load factor of 0.90 and 100% bucket fill factor. He works 54 minutes per hour, half the time digging and half setting pipe. Cycle time is estimated at 23 seconds which includes a 90° swing angle.

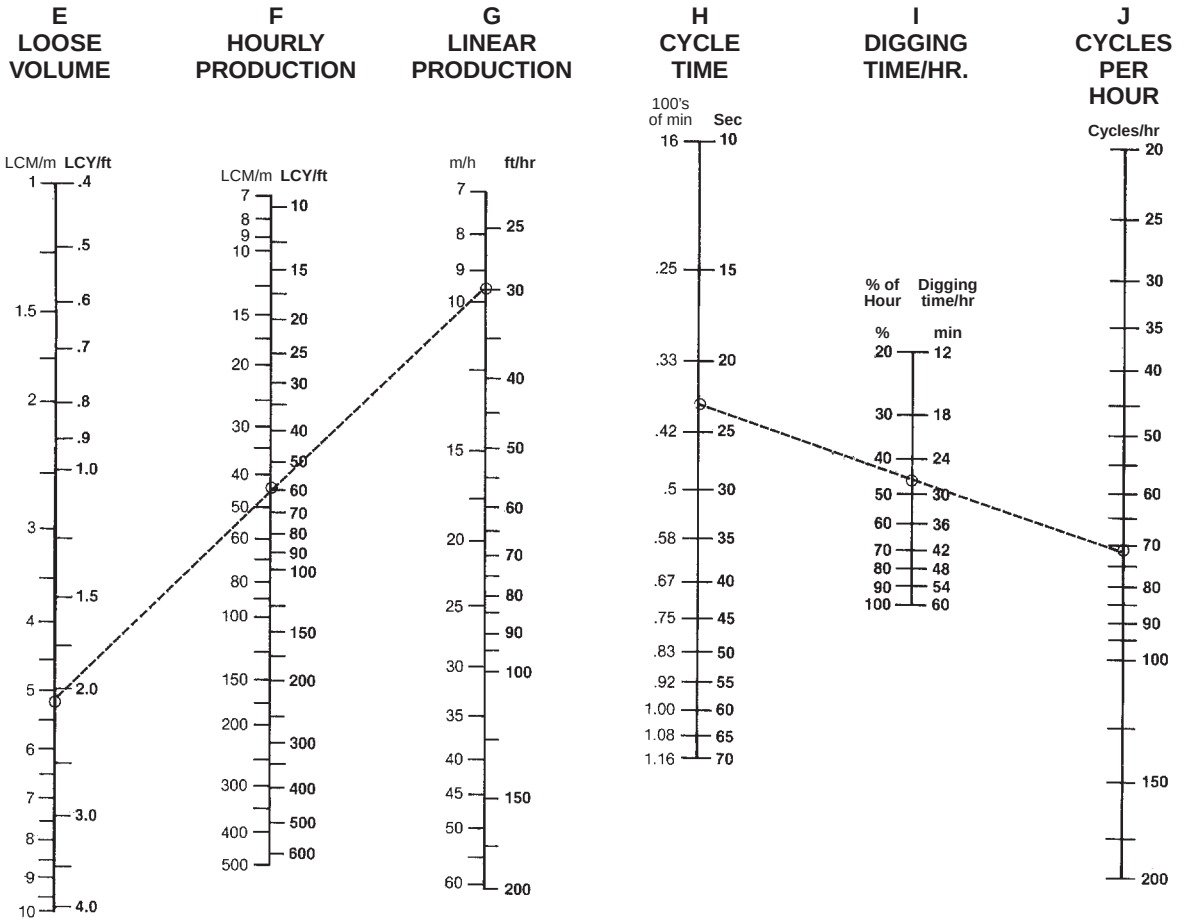
1) Enter trench depth 3.1 m (10') on scale A and average trench width 1.5 m (5') on scale B.
2) Connect A and B and extend to scale C for bank volume per m (ft).
3) Enter estimated load factor (0.90) on scale D.
4) Connect C & D and extend to scale E for loose volume per m (ft).



(continued next page)

(get loose volume from scale E and enter on this page scale E)

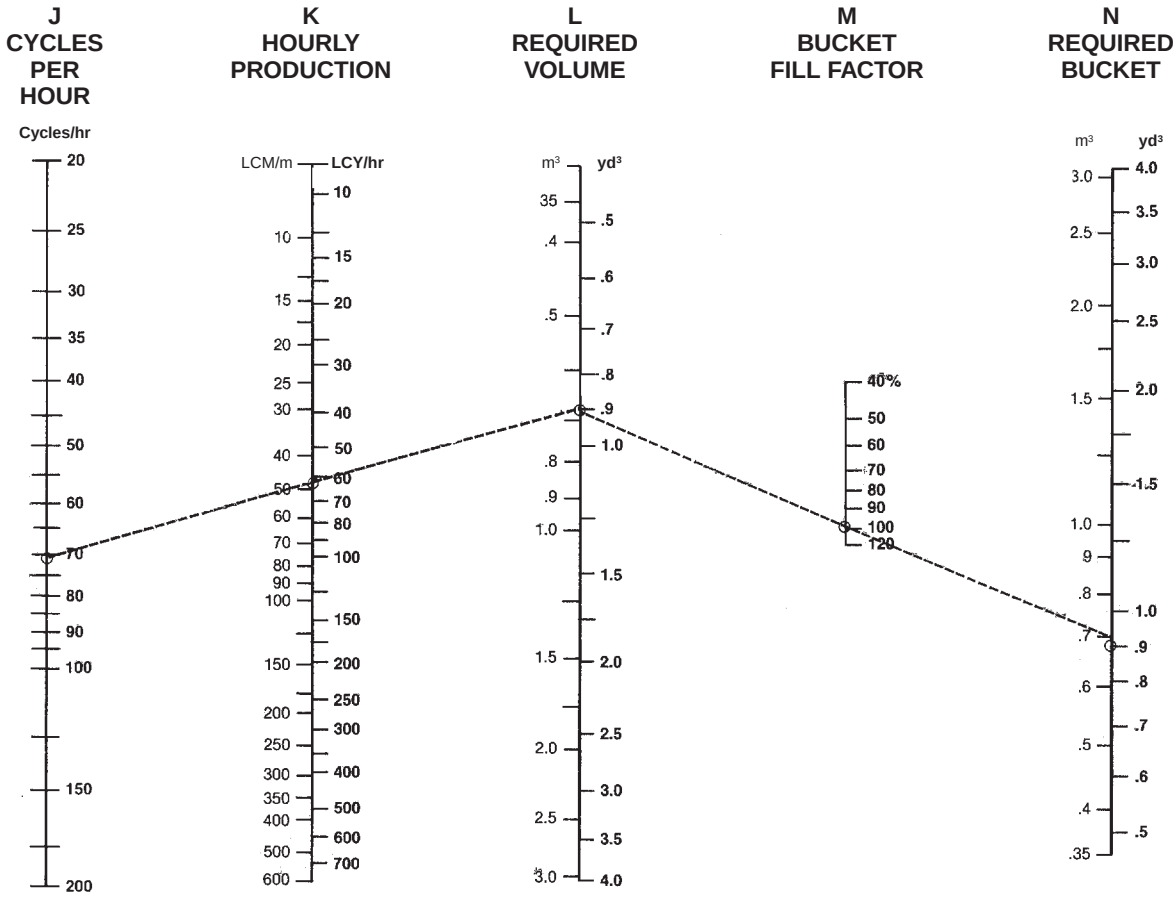
5) Enter required linear production rate 9 m/h (30 t/hr) on scale G.
6) Connect E and G. Transfer hourly production rate from scale F to scale K (next page).
7) Estimate cycle time (23 sec) based on anticipated conditions and enter on scale H.
8) Estimate hourly digging time (27 min) and enter on scale I.
9) Connect H through I to scale J for cycles per hour.

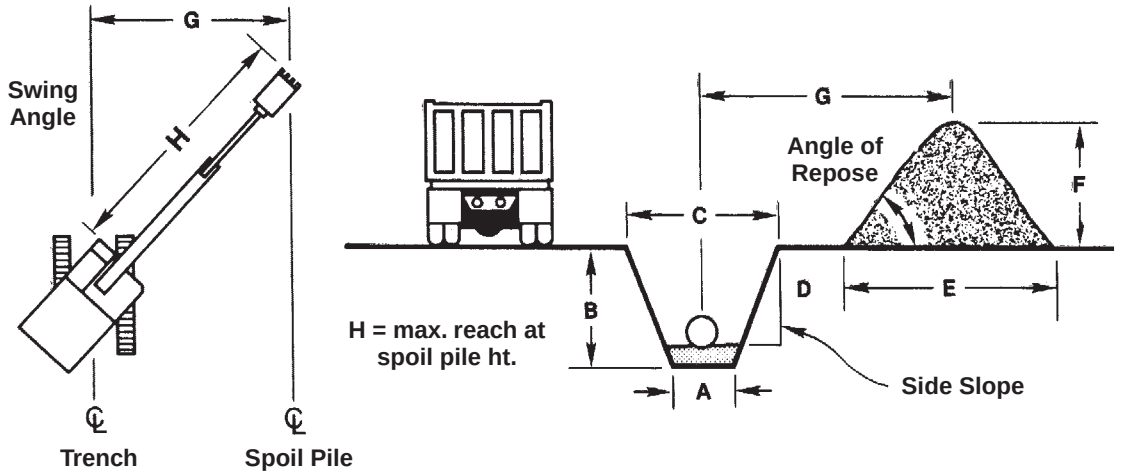


(get cycles per hour from scale J and enter on this page scale J)

10) Connect J through K to scale L for required volume per cycle.
11) Enter estimated bucket fill factor (100%) on scale M.
12) Connect L through M to scale N for required bucket size.

NOTE: Ensure bucket width does not exceed minimum trench width and also that weight of bucket and payload does not exceed machine working weight capacity (see lift capacity charts in this section).





Excavation Volumes Per Meter or Foot of Trench Length

Metric version

Bank m^3/meter = (Trench end area m^2) × (one m)
Trench volume (Bm^3/m) = ½ (A + C) × B
Spoil pile volume (Lm^3/m) = (Bm^3/m) × (1.00 + % Swell)

English version

$$\text{Bank } yd^3/\text{foot} = \frac{(\text{Trench end area } ft^2) \times (\text{one ft})}{27}$$

$$\text{Trench volume (BCY/ft)} = \frac{½\,(A + C) \times B}{27}$$

Spoil pile volume (LCY/ft) = (BCY/ft) × (1.00 + % Swell)

The following table provides a general guide to trench bottom width for various outside diameters of pipe.

Pipe Diameter		Trench Width		Pipe Diameter		Trench Width	
mm	ft/in	m	ft/in	mm	ft/in	m	ft/in
102	**4"**	0.49	**1'7"**	1524	**5'0"**	2.59	**8'6"**

Trenching Production with Pipesetting

On many sewer construction jobs the excavator does more than just dig the trench. Other tasks include handling the shoring system, placing bedding material, and lowering the pipe. The normal work procedure is to open a section of trench and then stop and make a pipe installation before going on to dig the next section of trench. At that point the key to trenching production is the total amount of time required to install each section of pipe. Pipe installation time can be broken down as follows:
Digging time + other time = Total pipe installation time

Total Pipe Installation Time	Pipe Installed Per Hour
60 min	1 Pipe/hr
30 min	2 Pipe/hr
15 min	4 Pipe/hr
10 min	6 Pipe/hr

Digging Time can be calculated once the trenching rate has been calculated using the methods described earlier in this section. Once Digging Time has been calculated, it can be added to an estimate of "Other Time" to determine Total Pipe Installation Time. "Other Time" can be estimated based on a contractor's judgment, experience, or actual measurement on a job. The following formula and table relate the trenching rate of the excavator to the time required to open a section of trench for pipe of various lengths.

$$\text{Digging Time (Min.)} = \frac{\text{Pipe Length (ft)}}{\text{Trenching Rate (ft/hr)}} \times 60 \text{ (Min/hr)}$$

Trenching Rate Ft. Per Hour	Time Required to Dig for Pipe of Various Lengths							
	8 ft Pipe		12 ft Pipe		16 ft Pipe		20 ft Pipe	
	Hours	Min.	Hours	Min.	Hours	Min.	Hours	Min.
20 ft/hr	0.400	24.00	0.600	36.00	0.800	48.00	1.000	60.00
40	0.200	12.00	0.300	18.00	0.400	24.00	0.500	30.00
60	0.130	8.00	0.200	12.00	0.260	16.00	0.333	20.00
80	0.100	6.00	0.150	9.00	0.200	12.00	0.250	15.00
100	0.080	4.80	0.120	7.20	0.160	9.60	0.200	12.00
120	0.060	4.00	0.100	6.00	0.120	7.20	0.167	10.00
140	0.057	3.43	0.086	5.14	0.114	6.86	0.143	8.57
160	0.050	3.00	0.075	4.50	0.100	6.00	0.125	7.50
180	0.044	2.66	0.067	4.00	0.089	5.33	0.111	6.67
200	0.040	2.40	0.060	3.60	0.080	4.80	0.100	6.00

This table can be used to show how an excavator that is capable of more trenching production will provide significant advantages even on jobs where the machine does not dig all of the time. Consider 12,000' job with 12' sections of pipe (1000 pipe to be installed). Excavator "A" can work at 60 ft/hr while Excavator "B" is capable of producing 120 ft/hr. Table shows that Excavator "B" will only take 0.10 hr to do the same work. This means that over the course of installing the 1000 pipe the more productive machine will save 0.10 hr/pipe or 100 hours of working time.

Example problem (English)

The following example shows how trenching production can be calculated on a job where the excavator is also required to set pipe. This example is based on the assumption that the excavator's earthmoving rate and the pipe installation time have already been estimated by the contractor.

Problem: Contractor estimates that the 350 Excavator will be able to produce 500 LCY/60 min. hr. Survey shows that an average cross section trench contains 3.2 BCY/ft and swell factor for sandy clay soil is estimated at 25%. How much trenching production can a contractor expect; assuming it takes 10.0 min. to install each 20 ft length of pipe after trench has been opened. Also assume 83% job efficiency — 50 min. work hour and 8 work hours out of a 9 hour shift. (0.5 hours for lunch and two 15 minute breaks.)

Solution:

Convert trench volume to LCY/ft:
1.25 (3.2 BCY/ft) = 4.0 LCY/ft

Convert Earthmoving rate to Trenching rate:

$$\frac{500 \text{ LCY/hr}}{4.0 \text{ LCY/ft}} = 125 \text{ ft/hr}$$

Calculate digging time for each pipe:

$$\frac{20 \text{ ft/pipe}}{125 \text{ ft/hr}} = 0.16 \text{ hr/pipe} = 9.6 \text{ min}$$

Calculate pipe installation time:

Digging time	= 9.6 min
Other time	= 10.0 min
Pipe Installation time	= 19.6 min

Calculate pipe installations/hour:

$$\frac{60 \text{ min/hr}}{19.6 \text{ min/pipe}} = 3.06 \text{ pipe/hr}$$

Calculate max. pipe installations/day:
8 hrs (3.06 pipe/hr) = 24.48 pipe/day

Actual pipe/day:
0.83 (24.48 pipe/day) = 20.3 – 20 pipe/day

Actual feet/day:
(20 pipe/day) × (20 ft/pipe) = 400 ft/day

Notes —

5000 SERIES
EXCAVATORS AND SHOVELS

CONTENTS

Features:

- **Cat Diesel Engines** provide the power, reliability and performance you can depend on.
- **Hydraulic Electronic Unit Injection (HEUI)** on the 5110B, and **Electronic Unit Injection (EUI)** on the 5130B and 5230 electronically maintains fuel settings, provides automatic altitude and air filter restriction compensation, automatic variable timing, improved diagnostics and increased fuel efficiency.
- **Advanced Modular Cooling System (AMOCS)** this patented cooling system used on the 5000 Series promotes more efficient engine cooling, and is easy to service.
- **Proportional Priority Pressure Compensation hydraulic system** delivers excellent controllability with full-powered response under all operating conditions.
- **Dedicated Swing Pumps** on the 5000 series ensures fast cycles, and consistent multi-function implement response.
- **Automatic Lubrication System** eliminates a daily lubrication chore, automatically lubricates the swing bearing, linkage, and undercarriage on regular intervals.
- **Vital Information Management System (VIMS)** on the 5130B and 5230 monitors all vital machine functions, and keeps the operator advised on current machine conditions. VIMS reduces downtime and allows service personnel easy access to data for fast accurate diagnosis.
- **Electronic Monitoring System II (EMS II)** on the 5110B monitors machine functions. The EMS II ensures that the engine and hydraulic system are perfectly matched to the operator's demand for the most efficient power transfer possible, it also keeps the operator advised on current machine conditions.
- **Durable Structures** are a key component in the 5000 Series. Large castings eliminate welds in high stress areas. Boom and sticks are thermally stress relieved to increase life. Boom and stick castings provide improved visibility over competitive designs. Penetrating, deep, beveled welds and rugged box section construction add to the machine's durability.
- **Service Access** is a priority on all 5000 Series machines. Platforms, walkways and hinged doors provide standing access to both sides of engine and pumps.

NOTE: Listed features may be standard on some models. Optional on others. Contact your Caterpillar Dealer for specific information.

CHOOSING A TRACK SHOE

In severe underfoot conditions, narrow shoes impose lower forces on other undercarriage components, and normally result in improved overall track life. Machines working in rock should be equipped with the narrowest available shoe. Wider shoes will improve flotation, but shoes wider than those shown here should not be used. Track shoe width has little effect on stability.

Double grouser shoes will provide adequate traction in most underfoot conditions, and are less damaging to floor and road surfaces. For additional traction in deep mud, or in rock applications which allow some grouser penetration, single grouser shoes are recommended. Hard, smooth quarry floors that allow little or no grouser penetration are best handled by the narrowest double grouser shoes.

CURL AND CROWD FORCES

Rated digging forces are the forces that can be exerted at the outermost cutting point. They are calculated by applying working relief hydraulic pressure to the cylinder(s) providing the digging force. Weight of components and friction are excluded from the calculations.

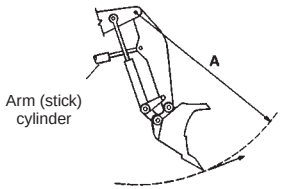

Figure 1

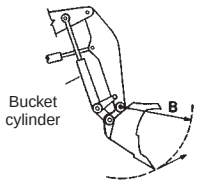

Figure 2

Rated Arm (Stick) Force — is generated by the arm (stick) cylinder and is tangent to the arc of radius "A". The arm is positioned to obtain the maximum output moment from the arm cylinder with the bucket positioned as in figure 1.

Rated Bucket Tangential Force — is generated by the bucket cylinders and is tangent to the arc of radius "B". The bucket is positioned to obtain the maximum output moment from the bucket cylinders and connecting linkage as in figure 2.

MAJOR BOTTOM DUMP BUCKET APPLICATION FEATURES:

- Controlled dumping action permits more accurate loading of narrow trucks with less chance of spillage. Closer bucket positioning over the truck, and metering the material flow on the first pass, lessens impact on truck bodies increasing their life.
- The bottom-dump clamping action is ideal for sorting in rock applications. Oversized material can be segregated for secondary breakage. In some cases, the operator can screen material as he dumps by limiting the bucket opening.
- Sticky material is easier to dislodge, thus avoiding material build-up which robs production. The bottom-dump bucket bulldozer assembly is nearly vertical when the bucket is fully open.

VITAL INFORMATION MANAGEMENT SYSTEM (VIMS): (5130 & 5230)

VIMS is a Caterpillar exclusive advanced diagnostic and equipment management tool designed to lower operating costs. Equipment utilization can be improved through higher mechanical availability, optimized component life, reduced risk of catastrophic failures, faster diagnostics and improved serviceability. VIMS includes both on-board hardware and an off-board software package — VIMS-PC.

The VIMS system "coaches" the operator to improve vehicle performance and productivity. On-board, VIMS is designed to work with the operator and not interfere with equipment operation. In-cab modules provide meaningful messages, indicators, gauges and warnings from sensors located throughout the machine. VIMS provides the operator immediate access to current machine information. VIMS data can also be transmitted for in-office/remote machine monitoring and analysis.

The CAT DATA LINK is the on-board network allowing communication between VIMS and the many machine mounted electronic control modules.

VIMS is like having a first rate mechanic riding in the cab with all of his diagnostic tools connected to the machine. Listening, watching, monitoring the entire vehicle by converting data signals from various sensors into meaningful information. VIMS displays information in "real-time" and records and stores information similar to a Flight Data Recorder on an airplane.

VIMS works with four types of information: 1. Internal (e.g.: service meter hours); 2. Sensed (e.g.: Exhaust Temperature); 3. Communicated (e.g.: Tach from ECM); 4. Calculated (e.g.: fuel consumption).

VIMS organizes and stores information into six categories: 1. Event List; 2. Event Recorder; 3. Data Logger; 4. Trends; 5. Cumulatives; 6. Histograms.

VIMS provides value to more than the operator. Whether you're in operations, maintenance, engineering, planning or management — Caterpillar's VIMS is your best choice for maximizing availability, productivity and reducing the risk of catastrophic failure while lowering overall cost.

ESTIMATING FRONT SHOVEL CYCLE TIME

The loading cycle of the front shovel is composed of four segments:

1. Load bucket
2. Swing loaded
3. Dump bucket
4. Swing empty

Total shovel cycle time is dependent on machine size and job conditions. As conditions become more severe (tougher loading, more obstacles, etc.), the shovel slows down accordingly.

The following table breaks down what experience has shown to be typical Caterpillar Front Shovel cycle times with above average job conditions and an operator of average ability.

These times would decrease as job conditions or operator ability improved and would become slower as conditions become less favorable. For example:

Tough material . . . . . .Longer bucket fill and dump time.
Greater swing angle . . . . . .Longer swing times.
Operator ability . . . . . .Affects total cycle time.
Loading from the top down . . . . . .May improve swing time.

CYCLE TIME vs JOB CONDITION DESCRIPTION

Fastest Possible
Good job set-up, tight swing.
Excellent operator.
Well fragmented material.

Fastest Practical
Typical job conditions.
Good operator.
60°–90° swing.

Typical Range
Oversized Material.
Undesirable set-up.
90°–120° swing.

Slow
Poorly shot material.
Bad floor conditions.
New operator.
120°–180° swing.

5

BOTTOM DUMP BUCKET FILL FACTORS

Material	Fill Factor*
Bank Clay; Earth	100%-105%
Rock-Earth Mixture	100%-105%
Rock — Poorly Blasted	85%-95%
Rock — Well Blasted	95%-105%
Shale, Sandstone — Standing Bank	85%-100%

*Percent of heaped bucket capacity.

Notes —

MATERIAL HANDLING ARRANGEMENTS

CONTENTS

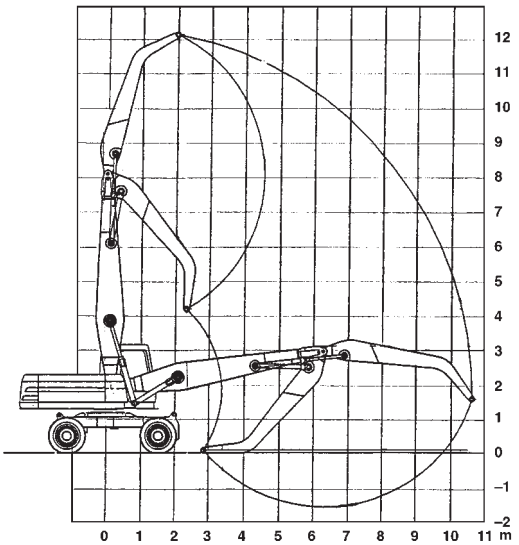
(Scrap specifications and classifications can be found in the Institute of Scrap Iron and Steel Inc.'s "Handbook". The common unit measure for the scrap industry is the gross ton which is 2240 pounds. However, short tons, net tons and metric tons may also be used.)

The versatility of Caterpillar Excavators, plus their ability to be equipped in any number of ways, make them an effective, low cost way to handle scrap and other materials.

NOTE: Contact your Caterpillar Dealer for additional information on equipping Caterpillar Excavators for material handling.

M325B MH Range Diagram

● Caterpillar Material Handling Boom and Stick



Model	M325B MH	
	m	ft
Maximum Horizontal Reach	13.4	**43'11"**
Maximum Vertical Pin Height	15.3	**50'4"**

Lifting Capacities

Equipped with Caterpillar material handling arrangement.

Includes purpose built material handling boom and stick.

Capacities are measured at the bare stick tip.

Capacities are based on level machine equipped as follows:

● Total machine weight including base machine, material handling front, 1.9 m manual tilt cab-riser, wide axles, 2 sets of outriggers, 20.5-25 tires, 6985 kg (15,400 lb) counterweight, lubricants and operator.
M325B MH — 34 960 kg (77,000 lb)

M325B MH with Cat two-piece, 13.4 m (43'11") front

**Limited by hydraulic rather than tipping load.
**Height of stick pin.

Load Radius Over Front

Load Radius Over Side

Load at Maximum Reach

The above loads are in compliance with hydraulic excavator lift capacity ratings standard ISO 21057/SAE 1097. They do not exceed 87% of hydraulic lifting capacity or 75% of tipping capacity.
Weight of all lifting accessories must be deducted from the above lifting capacities.

NOTE: All Material Handling Arrangements require extra wide gage, reinforced upper frame and additional counter weight.

Lifting Capacities

Equipped with Caterpillar material handling arrangement.

Includes purpose built material handling boom and stick, wiring and connecting hydraulics, hydraulic cylinders and heavier counterweight. Boom cylinder — 140 mm (5.5") diameter stick cylinder — 150 mm (5.9") diameter.

Capacities are measured at the bare stick tip, and are expressed in kg.

Capacities are based on level machine equipped as follows:

- Total machine weight including base machine, material handling front, 1.2 m fixed cabriser, wide gage undercarriage, counterweight, lubricants, full fuel tank and operator.
- 600 mm (2'0") triple grouser shoes.

320B MH — Heavy Duty Square Undercarriage configuration

Maximum reach, height and lift capacity (6.65 m boom and 5.4 m stick)

*Load limited by hydraulic capacity rather than tipping.

The above loads are in compliance with hydraulic excavator lift capacity ratings standard ISO 10567, they do not exceed 87% of hydraulic lifting capacity or 75% of tipping capacity. Weight of all lifting accessories must be deducted from the above lifting capacities.

Lifting Capacities

Equipped with Caterpillar material handling arrangement.

Includes purpose built material handling boom and stick , wiring and connecting hydraulics, hydraulic cylinders (boom cylinder — 150 mm (5.9") diameter, stick cylinder — 170 mm (6.7") diameter).

Capacities are measured at the bare stick tip, and are expressed in kg.

Capacities are based on level machine equipped as follows:

- Total machine weight including base machine, material handling front, 1.2 m fixed cabriser, wide gage undercarriage, counterweight, lubricants, full fuel tank and operator.
- 750 mm (2'6") triple grouser shoes.

*Indicates that the load is limited by hydraulic capacity rather than tipping capacity. Lift capacity ratings are based on SAE standard J1097.
Rated loads do not exceed 87% of hydraulic lifting capacity or 75% of tipping capacity.

Load Point Height — Load Radius Over Front — Load Radius Over Side — Load at Maximum Reach

*Load limited by hydraulic capacity rather than tipping.

**Height of stick pin.

The above loads are in compliance with hydraulic excavator lift capacity ratings standard ISO 21057/SAE 1097. They do not exceed 87% of hydraulic lifting capacity or 75% of tipping capacity. Weight of all lifting accessories must be deducted from the above lifting capacities.

*Indicates that the load is limited by hydraulic capacity rather than tipping capacity. Lift capacity ratings are based on SAE standard J1097. Rated loads do not exceed 87% of hydraulic lifting capacity or 75% of tipping capacity.

Notes —

BACKHOE LOADERS

CONTENTS

Features:

- **416C/426C/436C/446B** — center pivot backhoe.
- **428C/438C** — side shift backhoe design.
- **Single-tilt loader ...** features divergent loader arms, a narrow loader tower and single bucket tilt cylinder for improved visibility.
- **Integrated toolcarrier (parallel lift) loader ...** offers maximum lift and breakout forces, divergent loader arms, and parallel lift for efficient loading and material handling.
  - **Hydraulic Quick Coupler ...** allows a wide range of selected attachments, including those available for Cat integrated toolcarriers.
- **Excavator-style backhoe ...** provides enhanced visibility even with narrow buckets, ability to reach over obstacles, and faster, easier truck loading.
  - **Backhoe Quick Coupler ...** has high-rotation design for excellent vertical wall digging.
- **Load-sensing hydraulic system ...** provides full hydraulic power to implements at all engine speeds, low fuel consumption, smooth control and low lever efforts. A dual-setting torque limiter automatically optimizes hydraulics.
- **All wheel steer ...** is available on the 426C, 436C, and 438C. Full hydrostatic steering with three operator selected modes. Two wheel steer, circle steer, and independent rear maneuvering for the tightest turning circle in the industry.
- **Ride Control ...** available as an option on all C-Series machines. The Ride-Control system smooths the ride under all job-site conditions.
- **4F/4R fully synchronized gear box ...** provides on-the-go shifting in all gears and on-the-go engagement of optional all wheel drive.
- **Power-Shift transmission is available as an option on C-Series and is standard on 446B ...** for operator comfort and efficiency.
- **Brakes ...** are oil immersed, mutli-disc and self adjusting for long service life. Hydraulic assist allows low pedal effort.
- **E-Stick wear pads ...** are field replaceable and can be shimmed independently for reduced maintenance cost.
- **XT-3 hose with O-ring face seals ...** provides a dry, reliable machine.
- **Cat 3054 engine ...** proven reliability, durable gear-driven water pump, thermal starting aid, parts commonality, and low cost per hour. Large fuel tank for extended operation.
- **Sloping, flip-open hood ...** allows excellent visibility to the loader working area and tilts up for single location access to all daily service points.
- **Stackable counterweights ...** allow easy adjustment of machine weight distribution. Lockable tool and battery boxes.
- **Cat radial-seal air filter ...** is an air cleaner and precleaner in a single unit, eliminates hood-mounted precleaner.
- **Operator compartment features:** Air-suspension seat is standard, adjustable tilt steering is optional. Heating/air conditioning system with vents in the front console. Rear, door and side windows can be fully opened for enhanced visibility and cab roof is extended to help keep operator dry. Four-post Rollover Protective Structure (ROPS) for increased protection. Lunch box storage, rear mounted hand throttle, transmission disconnect switch on loader lift lever and low effort levers all add up to more precise control with a less fatigued operator.
- **Stabilizer legs ...** on the 428C and 438C use internal, self-lubricated, adjustable wear pads.

Work tools for Caterpillar backhoe loaders are divided into four groups	**Technical Assistance**
Caterpillar Factory Work Tools (Cat): Cat work tools installed on machines or shipped separately from the factory. Includes the most popular work tools such as buckets, forks and material-handling arms. (Note: hydraulic hammers are shipped separately.) *Order from Machine Orders Division.*	**Cat Factory Work Tools** (919) 550-1470
Caterpillar Work Tools (CWT): Cat work tools specifically designed for the Cat backhoe loader by the Caterpillar Work Tool division. *Orders inside U.S.: (800) 255-2372. Outside U.S.: 00 1 (785) 456-2224.*	**Cat Work Tools Product Support** (800) 255-2372
Wain Roy™ brand products by Woods Equipment Company (WR): Work tools and dedicated coupler system designed and manufactured to Cat specifications. *Orders inside U.S.: (800) 848-3447. Outside U.S.: 00 1 (815) 732-2124.*	**Wain Roy Product Support** (978) 928-3362
Alitec Power Attachments (AL): Work tools approved for use on Caterpillar backhoe loaders. *Orders inside U.S.: (800) 790-0557. Outside U.S.: 00 1 (317) 852-8622.*	**Alitec Product Support** (800) 790-0557

Auxiliary hydraulics: Hydraulic work tools may require auxiliary hydraulics. Refer to the following key for hydraulic requirements: (3rd valve is standard on all IT machines)

Multi-function loader hydraulics (3rd valve is required)	**MP**
Bi-directional flow backhoe hydraulics required	**BD**
Uni-directional flow backhoe hydraulics (universal lines) required	**UD**

CUT-TO-LENGTH

WHOLE TREE

MILLYARD

WORK TOOLS

TABLES

Methodology:

- **The Cut-To-Length method.** Is the most common Scandinavian way of timber extraction growing rapidly worldwide, today utilizing only two machines for the felling, processing, bucking, crosscutting, sorting and forwarding to the roadside. Increasing working season, less labor intensive, more safe, more selective cuttings, increasing environmental awareness, more challenging lay-out of cutting blocks, better documentation, more sensitive areas including less road building, mills demand for just in time deliveries are only a few of modern sustainable forestry practices challenges. The CTL method can meet most of these requirements in a variety of applications.

Harvesters:

- **Features.** The Caterpillar line of harvesters is one of the most recent forest products introductions by Caterpillar. The product line includes three models designed and built to provide customers with efficient solutions, in a wide variety of forestry applications. This complete line of wheeled harvesters produces high quality logs quickly by utilizing ample hydraulic flow and state-of-the-art controls to achieve both high feeding force and speed to the harvesting head.

  By utilizing the pendulum arm suspension technology, the operator is able to maneuver the machine in the tightest of thinning areas. Once in position, the operator can take full advantage of the extended reach to access trees in very dense conditions. All Caterpillar Harvesters are powered by a Caterpillar® 3126 DITA Engine which provides the necessary hydraulic flow and tractive mobility the machines need to harvest on steep slopes and unfavorable terrain, giving the customer the tools they need to drive an efficient and productive harvesting operation.

  Caterpillar harvesters can be used in a wide variety of applications, from first thinning to final felling, including a wide range of tree sizes. The 550, 570, and 580 Harvesters provide the versatility, durability and reliability today's logger needs to optimize the benefits of a cut-to-length harvesting system.

525B/535B Features:

- **Proven Cat 3126 diesel engine** is direct injection turbocharged and aftercooled.
- **Lock-up torque converter clutch,** an industry exclusive on Caterpillar Wheel Skidders…provides operating speed increases with improved power and fuel efficiencies.
- **5 speed forward powershift transmission…** provides better match of engine power to skidding requirements, with ease of operation.
- **Long wheelbase** for stability with large grapple loads and uphill skidding.
- **Front Axle Cradle oscillation** — helps improve machine stability with grapples and provides excellent ride for operator.
- **Enclosed oil disk brakes,** sealed, adjustment free, and fade resistant.
- **Locking differentials** — selectable from the cab to improve traction and controls wheel slip.
- **Dual wheel capable axles** available.
- **Load Sensing Hydraulic System** — variable displacement pressure compensating hydraulic system provides reduced power requirements when there is no hydraulic demand, significantly reduced heat generation, and improving fuel efficiency.
- **Single, dual-function arch and cable skidder options** available to meet various logging requirements.
- **Outstanding operator environment,** superior visibility, logical control placement, and significantly reduced hydraulic, steering, and transmission control efforts. ROPS structures meet OSHA regulations for roll-over and falling objects.
- **Single lever** grapple control.
- **Easy servicing** — minimal daily requirements, grouped and accessible grease fittings, accessible hydraulic oil sight gauges, engine oil dipstick and fuel cap. Access to components have been improved.

545 Features:

- **Proven Cat 3306 direct injected turbocharged and aftercooled diesel engine** provides power and outstanding durability and reliability.
- **Lock-up torque converter clutch,** an industry exclusive on Caterpillar Wheel Skidders…provides operating speed increases with improved power and fuel efficiencies.
- **Cradle Axle Oscillation.**
- **Enclosed oil disk brakes,** sealed, adjustment free, and fade resistant.
- **Locking differentials** — selectable from the cab to improve traction and controls wheel slip.
- **Protection for operator and machine** — ROPS structures and guarding provide operator and machine protection in the most severe logging environments.
- **Available with dual function** arch or cable skidder arrangements.

GRAPPLES

Grapples for Caterpillar Skidders are designed and built to Caterpillar specifications. All arches and grapples are factory installed and fully supported by Caterpillar. The following pages contain information on the available models, which are presented here to suggest a range of grapple possibilities. The specifications were supplied by the manufacturer and follow the SAE definitions listed below.

SAE specification definition

Reach (A, B, C, D) — The horizontal distance from the vertical center of the rear axle to the vertical center of the grapple fore and aft pivot.

A) With the grapple in its highest farthest position
B) With the grapple in its lowest farthest position
C) With the grapple in its highest fully retracted position
D) With the grapple in its lowest fully retracted position

Lift (E, F, G, H) — The vertical distance from the horizontal center of the rear axle to the horizontal center of the grapple fore and aft pivot.

E) With the grapple in its highest farthest position
F) With the grapple in its lowest farthest position
G) With the grapple in its highest fully retracted position
H) With the grapple in its lowest fully retracted position

Loaded Tire Radius (J) — Vertical distance from horizontal center of axle to horizontal reference plane.

Maximum Grapple Opening (K) — The horizontal distance between the tips of the grapple arms when grapple is fully open.

Area of Opening (L) — The available area with grapple in tips together position.

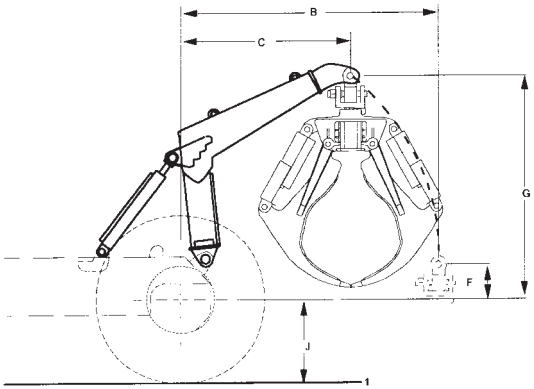
Minimum Log Size (M) — The smallest diameter which the grapple can close on.

Grapple Length (N, O, P) — The distance from the grapple fore and aft pivot to tips of grapple arms.

N) With grapple fully open
O) With grapple in tips together position
P) With grapple fully closed

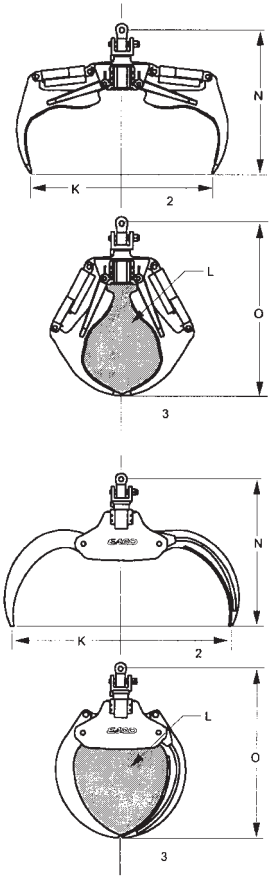
Single-function arch

- Versatile attachment suitable for selection or clear cut applications. Reach consists of one vertical arc and typical application is short cycles and/or larger diameter timber.

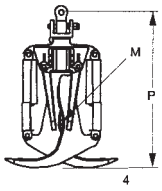


KEY

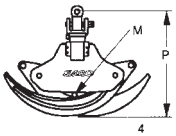
1 — Horizontal Reference Plane
2 — Fully Open
3 — Tip to Tip
4 — Fully Closed



Sorting grapple is designed to pick up individual or several stems for quick cycles of 305 mm (12") or larger diameter trees.



Bunching grapple is designed to gather bundled stems and maximize grapple loads of 305 mm (12") or smaller diameter trees.



Grapples for 525B		B	C	F	G	J	K	M	N	O	P	L

Dual-function arch

- Extended range provides extra reach for grabbing large bundles of feller bunched, small diameter logs.
- Ability to position load closer to tractor for improved stability and traction.
- Ability to push machine out of soft conditions.
- Typical applications include longer cycles and smaller diameter bunched timber.

Features 517 and 527:

- **Exceptional balance** — roller frames extended to rear significantly improves traction capability under heavy loads and uphill skidding applications.
- **Excellent ground clearance** — no diagonal braces allow tractor to pass over stumps and debris, reduces maneuvering for reduced cycle times and minimizes soil impact. Smooth belly pans are also less likely to hang up in mud or debris in soft ground or swamp logging applications.
- **Outstanding sidehill stability** — wide gauge and long track roller frames provide excellent sidehill capability.
- **Improved flotation** — more track on ground distributes tractor weight and propulsion forces over a much larger area than conventional track skidders or wheel skidders. This improves flotation capabilities, gradeability and significantly reduces soil impact.
- **Superior component durability** — final drives are raised above the work area, isolating the powertrain from ground impact shock loads and abrasive materials.
- **Outstanding reliability and durability** — built to handle the toughest logging conditions.

GRAPPLES

Fixed boom Grapples for Cat 517 and 527 Skidders are built and supplied by Caterpillar. Swing boom grapples are built to Caterpillar specifications. The following contains information on some of the available models, which are presented here to suggest a range of grapple possibilities.

Reach (A, B) — The horizontal distance from the vertical center of the rear idler to the vertical center of the grapple fore and aft pivot.

A) With the grapple in its lowest fully extended position.

B) With the grapple in its highest fully retracted position.

Lift (C, E) — The vertical distance from the ground to the center of the grapple fore and aft pivot.

C) With the grapple in its lowest fully extended position.

E) With the grapple in its highest fully retracted position.

Maximum Grapple Opening (K) — The horizontal distance between the tips of the grapple arms when grapple is fully open.

Area of Opening (L) — The available area with grapple in tips together position.

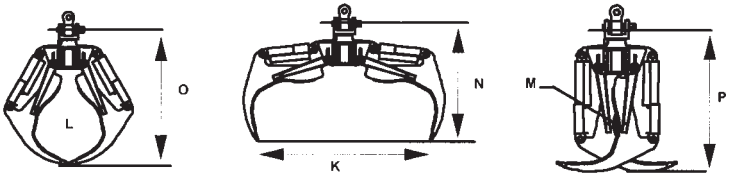
Minimum Log Size (M) — The smallest diameter which the grapple can close.

Grapple Length (N, O, P) — The distance from the grapple fore and aft pivot to tips of grapple arms.

N) With grapple fully open.

O) With grapple in tips together position.

P) With grapple fully closed.



Sorting Grapple

- Used for 305 mm (12") or larger diameter trees.
- Designed to pick up individual or several stems for quick cycles.

Bunching Grapple

- Used for 305 mm (12") or smaller diameter trees.
- Designed to gather bundle of stems and maximize grapple loads.

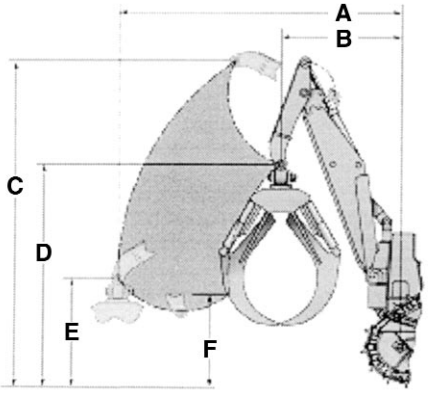
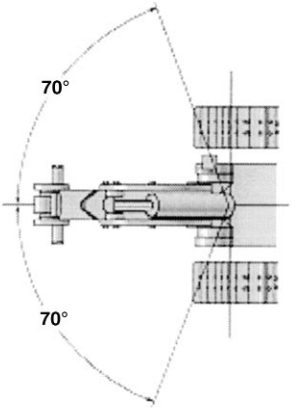
Swing-boom

- Ability to reach and lift over the side to collect scattered logs.
- Has decking and loading capability.
- Excellent reach to the rear and side for maximum skidder versatility.
- Suitable for hard to reach timber on steep slopes, soft ground, or selection harvest and thinning.
- Reduces cycle times by reducing the amount of maneuvering of the skidder to reach logs.





Swing-boom		A	B	C	D	E	F
517	mm	3269	1241	4092	2800	1366	1166

Introduction:

The 539 features 180 gross horsepower (134 kW), maximum reach of 32 ft (9.8 m), swing speed of 10.5 rpm and operating weight of 32,219 lb (17 827 kg). The main structures are purpose-built to handle the stress loads of pull-through delimbing and truck loading. The operator station is ergonomically designed to enhance operator productivity and comfort, and the load-sensing hydraulic system offers speed, power and precise control. Factory installed attachments, such as a fifth-wheel trailer, continuous-rotation grapple and a pull-through delimber, are available to increase machine application flexibility.

Features:

- The Cat 3126 DITA (direct-injected, turbocharged and aftercooled) six-cylinder, 7.2-liter engine produces 168 net horsepower (125 kW) at 2,200 rpm. High-pressure unit injectors provide fast engine response, excellent fuel efficiency and low emissions. All engine service points are easily accessed through two doors at the back of the loader.
- The 539 structures feature a main frame with integral fuel tank that eliminates the need for an external counterweight. The large diameter swing bearing matches the strength of the entire frame. The platform frame incorporates four wide-base stabilizers, and the boom and stick have large diameter double shear pins, wide boom-foot width and a single boom hoist cylinder to simplify the system for high reliability.
- The operator's station allows unobstructed sight lines to the work area while providing a safe, comfortable work environment. Low-effort joysticks control all implement functions, and the joystick consoles are suspended as part of the seat structure to move with the seat. A convenient lever deactivates hydraulic functions when the operator leaves the cab.
- High-pressure, load-sensing hydraulics offer reduced maintenance, extended component life, cooler oil temperatures and increased performance compared to other systems. Two variable displacement, axial piston pumps power the boom, stick, swing and attachments. One single-section, gear-type pump powers the pilot circuit for the controls.
- Factory-installed attachments can enhance versatility. Attachments include a fifth-wheel trailer, a pull-through delimber with topping saw, continuous-rotation grapple, and ground saw hydraulics.

The Caterpillar 539 Knuckleboom Loader is designed and built to increase production while enhancing safety and operator comfort.

LOAD CAPACITY CURVES FOR WHEEL LOADERS AND INTEGRATED TOOLCARRIERS EQUIPPED WITH FORKS

Definitions:

Hydraulic Capacity: Weight that the hydraulic system will lift with the rear of the loader anchored and the load center of gravity midway on the fork tines. Hydraulic capacity is not increased by counterweighting.

Tipping Load: The loaded weight positioned as described above, which will lift the rear wheels off the ground with the machine in a static condition. Static tipping load curves for wheel loaders equipped with log or lumber forks are based on full machine articulation.

Tipping load capacities are affected by counterweight and distance of the load center of gravity from the front axle and degree of articulation. Fork center of gravity and fork weight can also affect tipping load.

Maximum Operating Load: Maximum operating load should be based on static tipping load ratings (tines level) and requires a firm, smooth, well-maintained operating area. Maximum operating loads can be affected by:

- Underfoot conditions.
- Position or height the load is carried.
- Fork position or attitude.
- Degree machine is articulated during maneuvering.

● ● ●

Example problem:

Wheel Loader Selection 966G vs 950G

Optimum millyard performance depends on efficient and proper use of wheel loaders performing unloading, sorting and decking applications. The following steps will aid in the proper wheel loader selection.

Step 1: Determine the basic mill requirements (job description).

EXAMPLE:

Logs arrive at the mill on trucks equipped with double bunk trailers. Logs are a variety of hardwoods, but white oak makes up the majority of wood received. The trucks must be off-loaded by a wheel loader equipped with log forks.

In addition to the off-loading, a primary loader requirement is to supply the mill with raw material in a load-and-carry operation. The loader must also sort logs by species, grade and size, and transport the excess logs from the unloading area to the storage decks.

- Maximum sawmill requirements — 544 metric tons/8 hr. day (600 U.S. tons).
- Maximum wood received — 30 truckloads/8 hr. day.
- Average number of logs per truckload — 20.
- Average log specifications:
  — length 4.9 m (16').
  — butt diameter 660 mm (26").
  — top diameter 430 mm (17").
- Maximum truck stake height — 3.98 m (13'1").
- Maximum haul distance (one way) from log storage deck to the mill — 153 m (500').
- Haul and return to mill in 2nd forward — 10% effective grade.
- Fixed times — load forks 0.7 min.
  — maneuver and dump 0.5 min.
  — truck unloading 1.0 min.
- Average log weight = 1180 kg/log (2600 lb/log) Refer to Weights and Measure section of this handbook to obtain appropriate log volume and density information.

Step 2: Determine the basic machine options and capacities.

Refer to Capacity curves in the Performance Handbook under Logging and Forest Products section. For other fork configurations not listed contact the Forest Machinery Unit for performance curves. Also refer to attachment adaptability section for information needed for performance curves.

EXAMPLE:

Consider a 950G vs. 966G. Both are equipped with logging fork.

950G

Static Tipping Load	10 000 kg (22,000 lb)
Hydraulic Lift Capacity	11 600 kg (25,520 lb)
Maximum Operating Load	10 000 kg (22,000 lb)

966G

Static Tipping Load	13 500 kg (29,700 lb)
Hydraulic Lift Capacity	14 500 kg (31,900 lb)
Maximum Operating Load	13 500 kg (29,700 lb)

Step 3: Determine cycle times.

Refer to Production Travel Time Charts in the Wheel Loader section of the Performance Handbook.

EXAMPLE:
(Supplying the mill)

Description	Time (950G)	Time (966G)
Haul and return	1.16 min	1.14 min
Load Forks*	0.7 min	0.7 min
Maneuver and dump*	0.5 min	0.5 min
TOTAL	2.36 min	2.34 min
Cycles/45-min hr =	19.06	19.23

(Off-loading trucks)

Description	Time (950G)	Time (966G)
Truck unloading*	1.0 min	1.0 min
Load Forks*	0.7 min	0.7 min
Maneuver and dump*	0.5 min	0.5 min
TOTAL	2.2 min	2.2 min
Cycles/45-min hr =	20.45	20.45

*Fixed times which should be based on local experience.

Step 4: Calculate Production

EXAMPLE:

Mill requirements:

— 950G

$$\frac{544\ 320 \text{ kg (1,200,000 lb)/8 hr/day}}{10\ 000 \text{ kg (22,000 lb)/loader cycle}} = \frac{55 \text{ loader cycles}}{8 \text{ hr/day}}$$

$$\frac{55 \text{ loader cycles/8 hr/day}}{19.06 \text{ cycles/45-min hr}} = 2.88 \text{ hr/day required to supply mill}$$

— 966G

$$\frac{544\ 320 \text{ kg (1,200,000 lb)/8 hr/day}}{13\ 500 \text{ kg (29,700 lb)/loader cycle}} = \frac{41 \text{ loader cycles}}{8 \text{ hr/day}}$$

$$\frac{41 \text{ loader cycles/8 hr/day}}{19.23 \text{ cycles/45-min hr}} = 2.13 \text{ hr/day required to supply mill}$$

Off-Load Requirements:

— 950G

20 logs/truck × 30 truckloads/day = 600 logs/day

600 logs/day × 1180 kg (2600 lb)/log = 707 616 kg/day or 1,560,000 lbs/day Incoming Wood

$$\frac{707\ 616 \text{ kg (1,560,000 lb)/8 hr/day}}{10\ 000 \text{ kg (22,000 lb)/loader cycle}} = \frac{71 \text{ loader cycles}}{8 \text{ hr/day}}$$

$$\frac{71 \text{ loader cycles/8 hr/day}}{29.45 \text{ cycles/hr}} = 3.47 \text{ hr/day required to off-load wood}$$

— 966G

20 logs/truck × 30 truckloads/day = 600 logs/day

600 logs/day × 1180 kg (2600 lb)/log = 707 616 kg/day or 1,560,000 lbs/day Incoming Wood

$$\frac{707\ 616 \text{ kg (1,560,000 lb)/8 hr/day}}{13\ 500 \text{ kg (29,700 lb)/loader cycle}} = \frac{53 \text{ loader cycles}}{8 \text{ hr/day}}$$

$$\frac{53 \text{ loader cycles/8 hr/day}}{20.45 \text{ cycles/hr}} = 2.59 \text{ hr/day required to off-load wood}$$

Total Production Required:

— 950G = 2.88 hr/day to supply mill
3.47 hr/day to off-load
6.35 hr/day total time

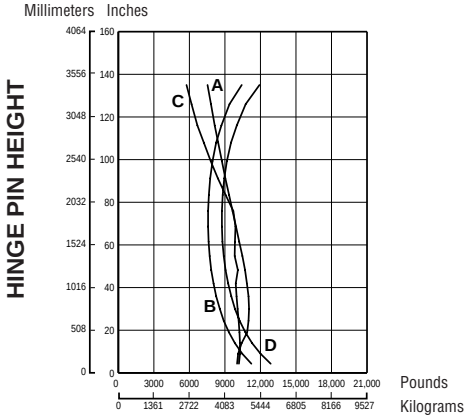
— 966G = 2.13 hr/day to supply mill
2.59 hr/day to off-load wood
4.72 hr/day total time

Step 5: Determine Wheel Loader selection.

EXAMPLE:

From the production study completed and assuming 100% efficiency it appears both machines are capable of handling the maximum daily production. The 950G and 966G will have 1.65 hrs/day and 3.28 hrs/day respectively to handle unscheduled activities such as sorting, storage and yard clean-up. However, after comparing the maximum hinge pin height for the two machines, the 950G is not capable of clearing the stakes with a load. This leaves the 966G as the machine to recommend, since it can handle all restrictions and production requirements.

914G with Caterpillar Lumber and Log Fork



CAPACITY IN FULL TURN NO CLAMP

KEY

A — Hydraulic Lift Capacity Fork Racked
B — Static Tipping Load Full 40° Turn Fork Level
C — Hydraulic Lift Capacity Fork Level
D — Static Tipping Load Machine Straight, Fork Level

Curves based on machine with full fuel tank, operator, 17.5R25 tires and 125-9293 lumber/log fork without top clamp. Fork weight is 616 kg (1358 lb). Total operating weight, 7464 kg (16,444 lb). Forks of other dimensions or weight may affect machine capacity. Consult your Caterpillar Dealer for additional fork data.

Features:

- The Caterpillar product line of harvesting heads is matched to the Caterpillar carriers. Four models of harvesting heads have been designed and built to handle a wide variety of forestry applications, while providing customers with efficient solutions to ensure success. This complete line of harvesting heads produces high quality logs quickly by utilizing ample hydraulic flow and state-of-the-art controls to achieve both high feeding force and speed.

  To ensure the highest accuracy when bucking and measuring, these heads feature a patented design that automatically centers the tree with the feed rollers while simultaneously varying pressure to provide maximum grip. Exact diameter measurements are made by digital sensors built into the delimbing knives. These features, combined with hydraulic control of the knives, will help prevent any unnecessary tree damage while processing.

  Caterpillar harvesting heads can be used in a wide variety of applications, from first thinning to clearcutting, in a wide range of diameters. These heads will provide the versatility, durability and reliability today's logger needs to optimize the benefits of a cut-to-length harvesting system.

MODEL	HH45	HH55	HH65	HH75

Features:

- **Full 360° continuous rotation.**
- **Applicable to** shovel logging and sorting applications.
- **Paddle style tines** are made of abrasion resistant material.
- **Induction hardened** pins and bushings.
- **Heavy well hydraulic cylinders** with large diameter rod and integral load check valves.

*BLF988DTC with bucket arrangement — must order Link Assembly #137519.

NOTE: Third valve required. Counterweight recommended.
Logging forks with millyard style clamps are available where logging application requires clamp to close between tines.
Contact your Caterpillar Dealer for more information.

USE OF LOG VOLUME TABLES

The tabulated volumes on these pages were calculated with no taper in log diameter from base to top. Therefore each value listed in the table represents the volume of a true cylinder. In practice this may occur only in short sections of large diameter trees. To obtain the volume of solid wood logs, excluding bark:

1. Establish the base diameter of the log inside the bark and above the butt flare (extreme end taper).
2. Repeat the procedure for the top (small end) of log.
3. Enter log volume table at each of the two established diameters. Move horizontally to the vertical column closest to the length of the log being measured.
4. Establish the volume figures for each end of the log, add the two together and divide by two to obtain average log volume.

38	1095	1068	1070	1064	1156
40	1220	1204	1200	1185	1296

UNIT OF MEASUREMENT DEFINITIONS

1 board foot	= 1/12 ft^3 of solid wood (1' × 1' × 1")
1000 board feet	= 83.33 ft^3 of solid wood
1 c. unit of wood	= 100 solid ft^3
	= 1200 board feet
	= 2.83^3
1 cord of wood	= 128 ft^3 of stacked logs
	= 3.62 m^3
1 unit of wood	= 200 ft^3 of loose chips
	= 5.66 m^3
1 cord of wood	= 0.85 units
1 Hoppus Ton	= 50 ft^3 (assumed)
	= 63.65 ft^3 (actual)
	= 600 board feet
	= 763.8 BF Brereton
	= 1.8 m^3 actual
	= 1.4 m^3 assumed
1 cubic meter	= 35.32 ft^3
	= 424 board feet
	= 333 board feet Hoppus tons
	= 0.555 Hoppus Tons
1 MBF Brereton	= 2.36 m^3
	= 785.4 board feet Hoppus
1 MBF Hoppus	= 1273 board feet-Brereton
MBF	= Thousand board feet
1 Super Foot	= 1 board foot
100 Super Feet	= 1000 board foot
	= 0.236 m^3
600 Super Feet	= 50 ft^3
1 lb/ft^3	= 16.0185 kg/m^3

CUBIC FEET OF SOLID WOOD PER CORD

Length of Sticks-Ft.	Diameter at Small End 1"-2.5"	2.5"-5.5"	Over 5.5"
2	65	84	91
4	64	82	89
8	59	77	84
12	54	71	78

RULE OF THUMB CONVERSIONS

1 c. unit of wood = 1.117 cords = 1.25 units of chips = 250 ft^3 of chips = 7.08 m^3
1 cord of wood = 85 ft^3 of solid wood = 1.06 units of chips = 2.41 m^3
1 unit of chips = 80 ft^3 of solid wood = 2.27 m^3
1 cord of wood = 500 board feet = 1.18 m^3
2000 pounds of chips = 500 pounds of pulp
1 cord = 212 ft^3 of chips = 6 m^3

Notes —

PIPELAYERS

CONTENTS

Features:

- **Planetary power shift** transmission on all models.
- **Kick-out helps prevent boom bending** as boom approaches near-vertical.
- **Sealed and Lubricated Track.**
- **Simplified Controls,** two levers control all functions including raise, lower, quick-drop and power down, high and low range and speed adjustments.
- **Modular design of major components and accessory drive system** for simplified repair.
- **Separate, self-energizing brakes** for boom and hook winches.
- **Positive** track pin retention (583R and 589).
- **Hydraulic Drawworks** with two independently driven hydraulic motors for boom and hook winches.
- **Suspended Undercarriage** for improved ride and greater operator comfort (589).

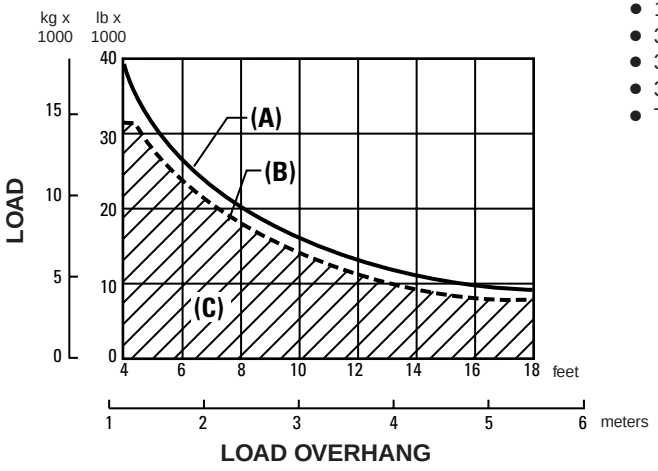
561M

LIFTING CAPACITY* 5.49 m (18'0") BOOM



*Specified Equipment:

- 16 mm **(5/8")** diameter wire rope.
- 18 688 kph **(41,200 lb)** minimum breaking strength.
- 3 part load line.
- 3 part boom line.
- 3270 kg **(7208 lb)** counterweight extended.
- Total operating weight 16 240 kg **(35,804 lb)**.

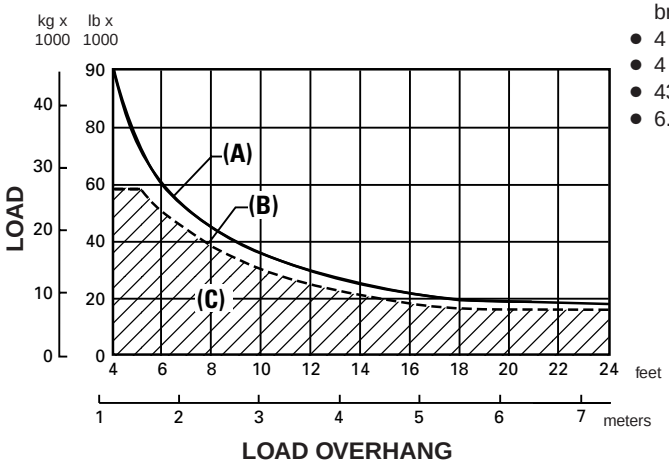
KEY

A — Max lift capacity per ANSI/SAE J743 MAR92
B — Rated load per ANSI/ASME B30.14
C — Working range per ANSI/ASME B30.14

8

572R

LIFTING CAPACITY* 6.1 m (20'0") BOOM



*Specified Equipment:

- 19 mm **(3/4")** dia. wire rope 26 670 kg **(58,800 lb)** minimum breaking strength.
- 4 part load line.
- 4 part boom line.
- 4330 kg **(9525 lb)** of counterweights extended.
- 6.1 m **(20'0")** Boom.

KEY

A — Max lift capacity per ANSI/SAE J743 MAR92
B — Rated load per ANSI/ASME B30.14
C — Working range per ANSI/ASME B30.14

PIPELAYER APPLICATION CALCULATIONS:

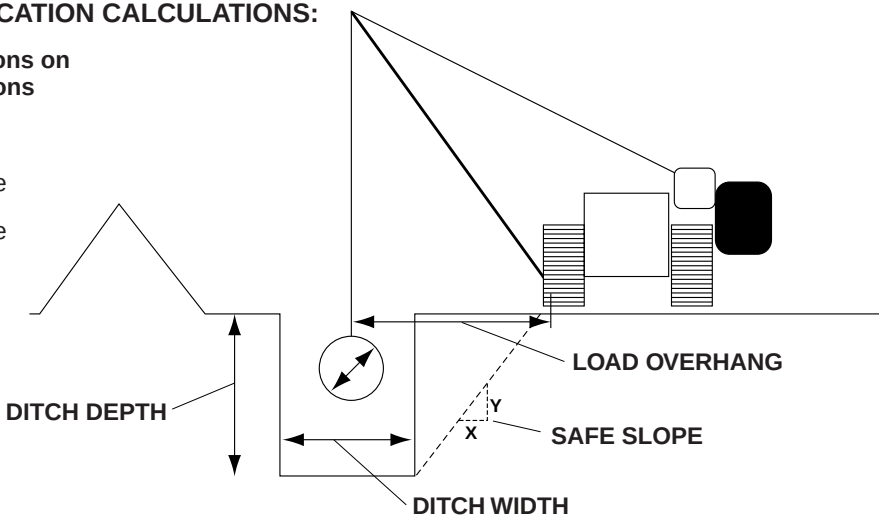
Typical pipelayer applications on flat, firm underfoot conditions

561M laying 8 to 16" pipe

572R laying 16 to 24" pipe

583R laying 24 to 38" pipe

589 laying over 40" pipe



The chart above provides general information representing typical pipelayer applications. While the following scenario explores many of the variables involved in pipelaying it does not cover all the possible variables that must be considered by pipelaying contractors.

When sizing pipelayers for an application there are many considerations other than the machine's SAE rated lift capacity. These include but are not limited to:

- pipe diameter and weight per linear foot
- ditch width and depth
  ditch width is typically 2 × pipe diameter
  ditch depth is typically >2.5 × pipe diameter
- distance from the ditch (safe slope) required by soil stability conditions
  typically 2:1 (meaning the pipelayer must be 2 × ditch depth from the ditch edge)
- acceptable distance between pipe lifting points while suspended (to prevent bending)
  determined by the pipe's bending characteristics. If the lifting points are too far apart a pipe can sag enough due to its own weight that it will damage itself.
- the operating safety factor desired by the contractor
- the length of pipe that will need to be suspended while laying-in
  determined by pipe bending characteristics, terrain, etc.
- ground conditions, road bed preparation

An important consideration is the necessary load overhang. This is the distance from the center of the pipe to the tractor's left track rail. The load overhang required for an application can be estimated by:

- load overhang = safe slope× ditch depth + (0.5 × ditch width)

The pipelayer's rated load capacity at a specific load overhang (per ANSI/ASME B30.14) can be found in the load capacity graphs in this section of the performance handbook. Once the load capacity is determined the maximum lift point spacing can be estimated by:

- $\text{max lift point spacing} = \dfrac{\text{load capacity at load overhang}}{\text{safety factor} \times \text{pipe weight per linear foot}}$

The maximum distance between pipe lift points (based on pipe bending characteristics) may be a shorter distance than the maximum spacing between lift points as calculated based on pipelayer load capacity. If this is the case, then in order to avoid damaging the pipe, the shorter distance should be considered to be the maximum distance between pipelayers.

As an example, consider a project involving 0.5" wall 24" diameter pipe which has a weight per linear foot of 125.5 lb and the soil has a safe slope of 2. Using the above formulas:

- the ditch depth would be 3 × 2 ft = 6 ft deep
- the ditch width would be 2 × 2 ft = 4 ft
- the load overhang would be 2 × 6 ft + (0.5 × 4 ft) = 14 ft

Using the 572R's lift capacity chart we find that the 572R has an ANSI rated load capacity of approximately 21,250 lb at a 14 ft load overhang.

When using rated load numbers it is important to understand that the lift capacity charts are based on SAE and ANSI test procedures that rate pipelayers on level, concrete surfaces. Working on softer underfoot conditions, working on slopes, (and other) can greatly reduce the pipelayer's load capacity.

If the contractor employs a safety factor of 2 then the maximum spacing between pipe lift points is:

$$\frac{21{,}250 \text{ lb}}{2 \times 125.5 \text{ lb/ft}} = 84.7 \text{ ft}$$

It is important to remember that this is the distance between the lift points, not the distance nose-to-tail between pipelayers. For this example, assume that 500 ft of pipe must be suspended during the laying-in process.

$$\frac{500 \text{ ft}}{84.7 \text{ ft per pipelayer}} = 5.9 \text{ which means that six pipelayers are needed}$$

The number of pipelayers required could also be determined by a second method:

$$\frac{\text{ft of pipe suspended} \times \text{pipe weight per ft} \times \text{safety factor}}{\text{rated load at overhang}}$$

In this case:

$$\frac{500 \text{ ft} \times 125.5 \text{ lb/ft} \times 2}{21{,}250 \text{ lb}} = 5.9 \text{ which again implies six pipelayers}$$

If, in this same example, soil conditions required a safe slope of 2.33 then the load overhang would have been 16 ft. At this load overhang the 572R's rated load capacity is approximately 18,125 lb. Using the equations above, this results in 72.2 ft between lift points which means that seven 572R pipelayers are now necessary. Using the second method:

$$\frac{500 \text{ ft} \times 125.5 \text{ lb/ft} \times 2}{18{,}125 \text{ lb}} = 6.9 \text{ again implying that seven 572R pipelayers are needed}$$

Rather than adding another pipelayer, 583R's could be used. At a 16 ft load overhang the 583R has a rated load capacity of 29,400 lb. This translates to 117.1 ft between lift points. If the pipe's bending characteristics will allow this space between lift points, the job could be done with only five 583R's.

WHEEL TRACTOR-SCRAPERS

CONTENTS

Features:

- **VHP engines** that deliver 10% more horsepower in gears 3 through 8 in the 620, 630 and 650 series.
- **Controlled throttle shifting** improves power train life by reducing fuel injection rate just prior to shifting in the 620, 630 and 650 series.
- **(HEUI) Hydraulic Electronic Unit Injection** and **(EUI) Electronic Unit Injection** electronically maintains fuel settings as well as automatically derate for altitude and air filter restrictions.
- **Hydraulic retarder** protects engine from over speeding and extends brake life on grades in the 620, 630 and 650 series.
- **Electro-hydraulic implement controls** replaces cab pilot valve and associated lines in the 620G cab.
- **Single lever implement control** — bowl, apron, ejector, elevator, transmission hold, cushion hitch, and optional bail/auger are controlled by one lever in the 620G.
- **Simplified transmission control** on the 620G. Gear selection choices are 1, 2, and D. Operator can override transmission by manually selecting top gear.
- **627G rear engine** can be started from the cab. Tachometer can monitor either front or rear engine.
- **627G Scraper EMS information** can be viewed in the cab by pressing a tractor/scraper switch. If EMS senses a fault in the scraper, it will automatically switch from tractor to scraper.
- **Eight speed semi-automatic power shift transmissions** used in the 620, 630, and 650 series.
- **Six speed power shift transmissions** used in the 610 series.
- **Differential lock** connects both tractor drive wheels in poor underfoot conditions for positive traction.
- **Cushion Hitch** on 620, 630, and 650 series (axle suspension on 615C Series II) absorbs haul road shocks, prevents loping as well as promotes operator comfort.

Tandem Powered:

- **Push-Pull arrangement** allows tandem engine scrapers to assist one another in loading. Recommended for high production applications.

Elevating:

- **Infinitely variable elevator speed** on 623G and 633F while the 610 series has a two speed elevator.

Auger:

- **Factory installed attachment** provides self loading capability in standard and tandem powered scrapers. Wide material appetite and conditions material which promotes compaction in the fill.

The auger scraper is a self-loading system that offers an alternative to conventional, push-pull or elevating scrapers. An independent hydrostatic system powers the auger which is located near the center of the bowl. The rotating auger lifts and evenly distributes over 50% of the material that flows over the scraper cutting edge. This action reduces the cutting edge resistance allowing the wheel tractor-scraper to continue moving through the cut and quickly obtain full rated loads.

Advantages:

- Self-load in equal or less time
- Requires shorter cut distance
- Complete material ejection (angled ejector pushes material)
- Significantly reduces dust problems in dry material
- Increased tire life
- Broader material appetite
- Better material retention on haul road (closed apron instead of open elevator)

The auger scraper is a self-loading system that offers an alternative to conventional, push-pull or elevating scrapers. An independent hydrostatic system powers the auger which is located near the center of the bowl. The rotating auger lifts and evenly distributes over 50% of the material that flows over the scraper cutting edge. This action reduces the cutting edge resistance allowing the wheel tractor-scraper to continue moving through the cut and quickly obtain full rated loads.

Advantages:

- Self-load in equal or less time
- Requires shorter cut distance
- Complete material ejection (angled ejector pushes material)
- Significantly reduces dust problems in dry material
- Increased tire life
- Broader material appetite
- Better material retention on haul road (closed apron instead of open elevator)

USE OF RIMPULL-SPEED-GRADEABILITY CURVES

The following explanation applies to Rimpull-Speed-Gradeability curves for Wheel Tractor-Scrapers, Construction & Mining Trucks/Tractors and Articulated Trucks.

Maximum speed attainable, gear range and available rimpull can be determined from curves on the following pages when machine weight and total effective grade (or total resistance) are known.

Rimpull is the force (in kg, lb or kN) available between the tire and the ground to propel the machine (limited by traction).

Weight is defined as Gross Machine Weight (kg or lb) = Machine + Payload.

Total Effective Grade (or Total Resistance) is grade resistance plus rolling resistance expressed as percent grade.

Grade is measured or estimated.

Rolling resistance is estimated (see Tables section for typical values.)

10 kg/metric ton (20 lb/U.S. ton) = 1% adverse grade.

Example

With a 6% grade and a rolling resistance of 40 kg/metric ton (80 lb/U.S. ton), find total resistance.

Rolling resistance = 40 kg/t ÷ 10 = 4% Effective Grade

(English: 80 lb ÷ 20 = 4%)

Total resistance = 4% rolling + 6% grade = 10%

Altitude Derating

Rimpull force and speed must be derated for altitude similar to flywheel horsepower. The percentage loss in rimpull force approximately corresponds to the percentage loss in flywheel horsepower. See Tables Section for altitude derations.

Rimpull-Speed-Gradeability

To determine gradeability performance: Read from gross weight down to the % of total resistance. (Total resistance equals actual % grade *plus* 1% for each 10 kg/metric ton (20 lb./U.S. ton) of rolling resistance.) From this weight-resistance point, read horizontally to the curve with the highest obtainable speed range, then down to the maximum speed. Usable rimpull depends upon traction and weight on drive wheels.

Example problem:

A 631E Series II with an estimated payload of 34 020 kg (75,000 lb) is operating on a total effective grade of 10%. Find the available rimpull and maximum attainable speed.

Empty weight payload = Gross Weight
44 200 kg + 34 020 kg = 78 220 kg
(97,460 lb + 75,000 lb = 172,460 lb)

Solution: Using graph on the next page, read from 78 220 kg (172,460 lb) (point A) on top of gross weight scale down the line to the intersection of the 10% total resistance line (point B).

Go across horizontally from B to the Rimpull Scale on the left (point D). This gives the required rimpull: 7756 kg (17,100 lb).

Where the line cuts the speed curve (point C), read down vertically (point E) to obtain the maximum speed attainable for the 10% effective grade: 12.9 km/h (8 mph).

ANSWER: The machine will climb the 10% effective grade at a maximum speed of 12.9 km/h (8 mph) in 4th gear. Available rimpull is 7756 kg (17,100 lb).

B — Intersection with 10% total resistance line
C — Intersection with rimpull curve (4th gear)
D — Required rimpull 7756 kg (17,100 lb)
E — Speed 12.9 km/h (8 mph)

USE OF TRAVEL TIME CHARTS

The following explanation applies to travel time charts for Wheel Tractor-Scrapers, Construction & Mining Trucks and Articulated Trucks.

One-way travel time can be determined from graphs on the following pages when one-way travel distance and total resistance (expressed in percent) are known. 10 kg/metric ton (20 lb/U.S. ton) equals 1% equivalent grade.

If total resistance is negative (grade assistance greater than rolling resistance) machine may accelerate downhill requiring the use of retarder or brakes. Travel time charts *cannot* be used in these cases. Consult respective machine retarder curve to establish maximum safe downhill speed.

Two graphs are given for each hauling unit: one for the machine carrying its rated payload and one for the empty machine.

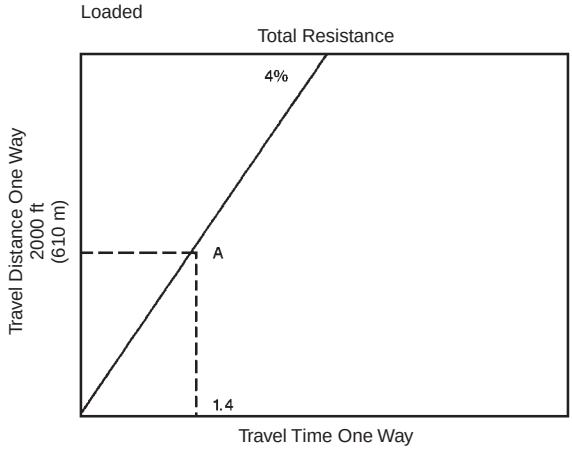
Travel times were derived using Caterpillar Machine Simulation Program and standard tire inputs. Travel times for machines equipped with (larger) optional tires vary slightly.

Example problem:

631E Series II hauls its rated payload 34 020 kg — 19.1 bank cubic meters (75,000 lb — 25 bank cubic yards) on a 4% road for 610 m (2000 feet) and returns on a 0% road for 760 m (2500 feet). Find the cycle time.

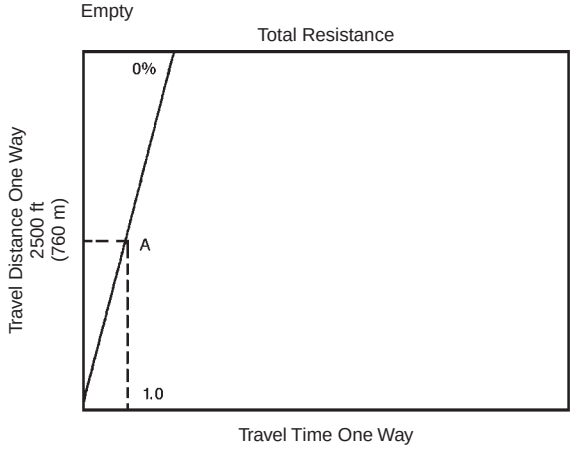
Haul —

Using the graph for the Loaded machine, read from the Travel Distance (one way) scale at 610 m (2000 feet) across to the 4% total resistance line (point A). From (point A) read down to the Travel Time (one way) scale to determine haul time = 1.4 minutes.



Return —

Using the graph for the Empty machine, read from the Travel Distance (one way) scale at 760 m (2500 feet) across to the 0% total resistance line (point A). From (point A) read down to the Travel Time (one way) scale to determine return time = 1 min.



Cycle Time —

= load* + haul + maneuver & spread* + return
= 0.6 + 1.4 + 0.7 + 1.0
= 3.7 min.

*For fixed time (load, maneuver and spread) see the table below.

When cycle time and payload are known, productivity can be calculated. For a more complex example see the Earthmoving Section.

●●●

TYPICAL FIXED TIMES FOR SCRAPERS

(Times may vary depending on job conditions)

Model	Loaded By	Load Time (Min.)	Maneuver and Spread or Maneuver and Dump (Min.)
613C Series II	Self	0.9	0.7
615C Series II	Self	0.9	0.7
623G	Self	0.9	0.7

651E	One D11R	0.6	0.7
657E	One D11R	0.6	0.6
657E	Push Pull Self	1.1*	0.6
621G	Auger	0.9	0.7
627G	Auger	0.7	0.7
631E Series II	Auger	0.9	0.7
637E Series II	Auger	0.8	0.7
651E	Auger	1.3	0.7
657E	Auger	1.0	0.7

*Load time per pair, including transfer time.

NOTE: Empty Weights shown on the Wheel Tractor-Scraper charts includes ROPS Canopy. The travel times will remain within acceptable limits when applied to a non-ROPS equipped machine. When calculating TMPH loadings *any* additional weight must be considered in establishing mean tire loads.

USE OF RETARDER CURVES

The following explanation applies to retarder curves for Wheel Tractor-Scrapers and Articulated Trucks.

The speed that can be maintained (without use of service brake) when the machine is descending a grade with retarder fully on can be determined from the retarder curves in this section if gross machine weight and total effective grade are known.

Total Effective Grade (or Total Resistance) is grade assistance *minus* rolling resistance.

10 kg/metric ton (20 lb/U.S. ton) = 1% adverse grade.

Example

15% favorable grade with 5% rolling resistance. Find Total Effective Grade.

Total Effective Grade = 15% Grade Assistance — 5%

Rolling Resistance = 10% Total Effective Grade Assistance.

Example problem:

A 651E with an estimated payload of 47 175 kg (104,000 lb) descends a 10% total effective grade. Find constant speed and gear range with maximum retarder effort. Find travel time if the slope is 610 m (2000 ft) long.

Empty Weight + Payload = Gross Weight
= 60 950 kg + 47 175 kg = 108 125 kg
(134,370 lb + 104,000 lb = 238,370 lb)

Solution: Using the retarder curve below, read from 108 125 kg (238,370 lb) (point A) on top of gross weight scale down the line to the intersection of the 10% effective grade line (point B).

Go across horizontally from point B to the intersection of the retarder curve (point C). Point C intersects at the 5 (5th gear) range.

Where point C intersects the retarder curve, read down vertically to point D on the bottom scale to obtain the constant speed: 21.7 km/h (13.5 mph).

ANSWER: The 651E will descend the slope at 21.7 km/h (13.5 mph) in 5th gear. Travel time is 1.68 minutes.

$$\frac{610\text{ m}}{363\text{ m/min}} = 1.68\text{ min}$$

*(mph × 88 = F.P.M.)

$$\frac{2000\text{ ft}}{13.5\text{ mph} \times 88^*} = 1.68\text{ min}$$

NOTE: The basic Distance-Speed-Time formula is 60 D ÷ S = T (or "60 D Street"), where 60 is minutes, D is distance, S is speed and T is time. In the above problem, 60 × 610 m ÷ 21.7 km/h × 1000 = T.

$$\frac{60 \times 610}{21.7 \times 1000} = T = (1.68)$$

CONDITIONS: Flat haul. Percentages shown are rolling resistance only.
100% efficiency (60 min hour).

- Material: 1780 kg/m³ (3000 lb/yd³).
- Payload: 34 020 kg, 19.1 Bm³ (75,000 lb, 25 BCY).
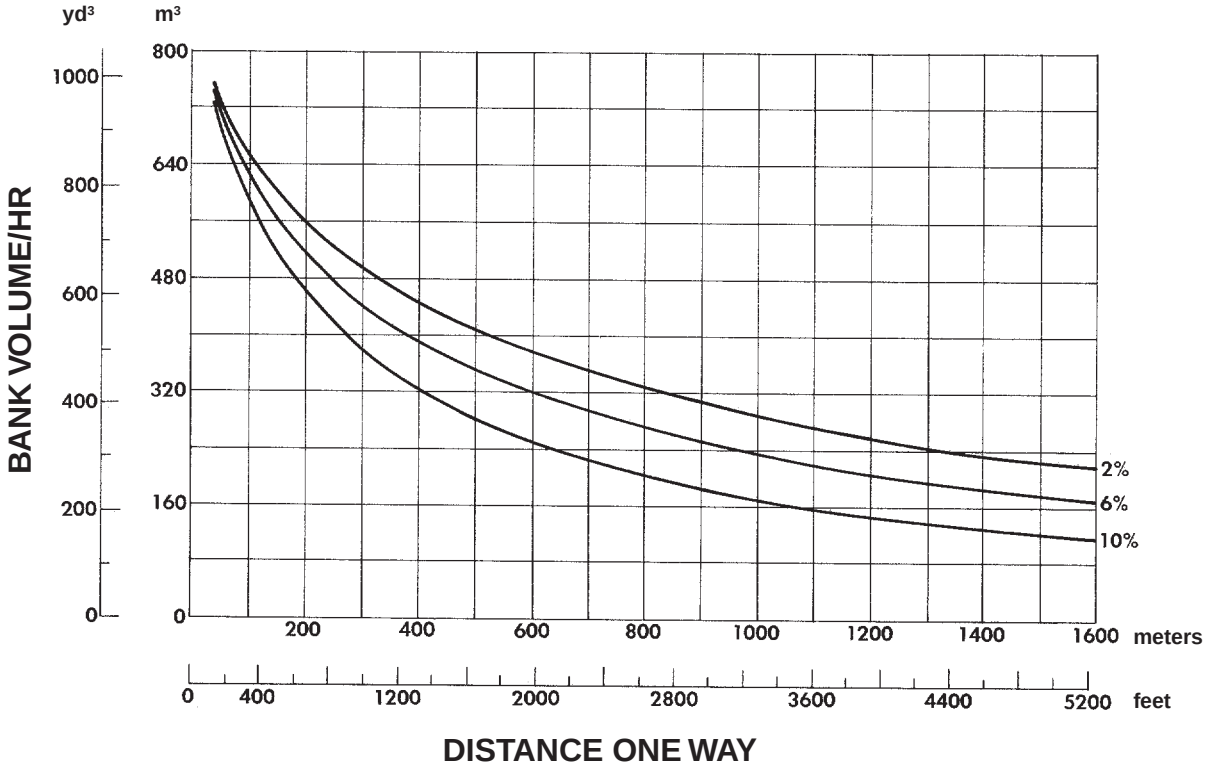
- Empty weight: 51 110 kg (112,670 lb).
- Fixed time: 1.1 min.

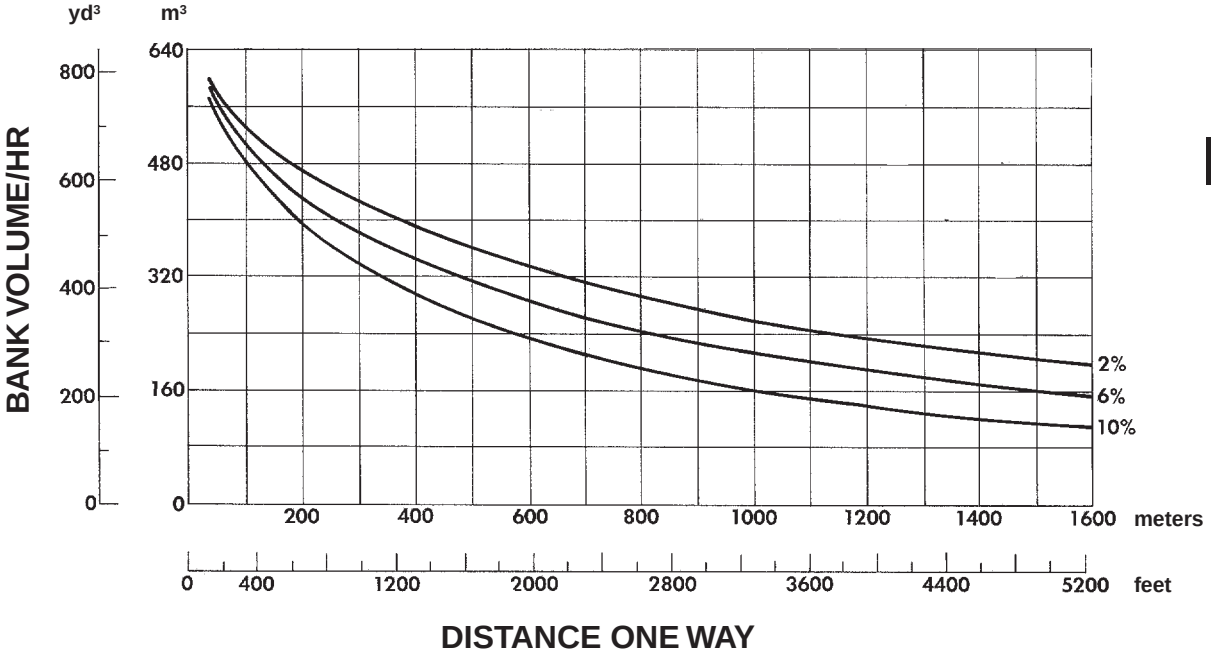


DISTANCE vs. PRODUCTION

CONDITIONS: Flat haul. Percentages shown are rolling resistance only.
100% efficiency (60 min hour).

- Material: 1780 kg/m³ (3000 lb/yd³).
- Payload: 34 020 kg, 19.1 Bm³ (75,000 lb, 25 BCY).
- Empty weight: 52 650 kg (116,070 lb).
- Fixed time: 1.6 min. (includes loading both units and transfer time).

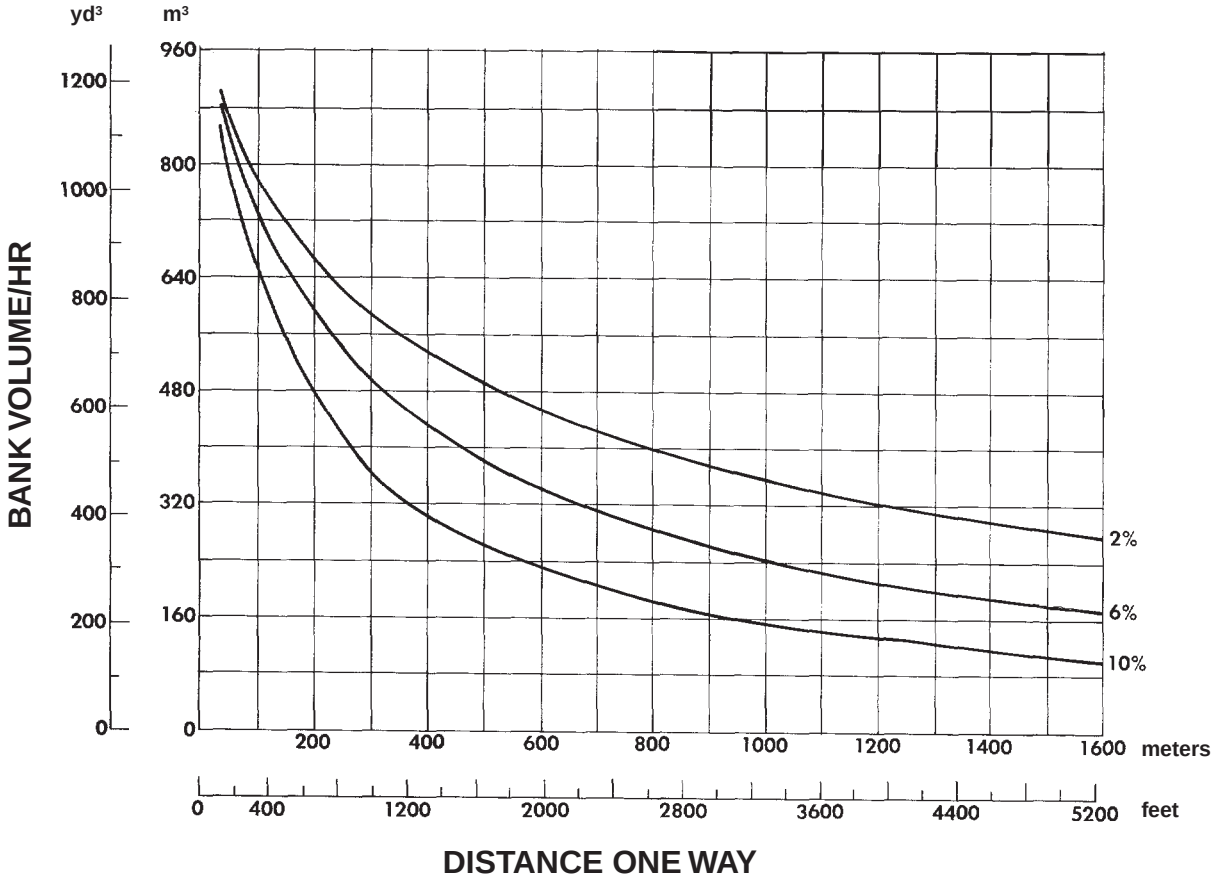
NOTE: Production estimates apply to one unit. Double these figures for a push-pull pair.



DISTANCE vs. PRODUCTION

CONDITIONS: Flat haul. Percentages shown are rolling resistance only.
100% efficiency (60 min hour).

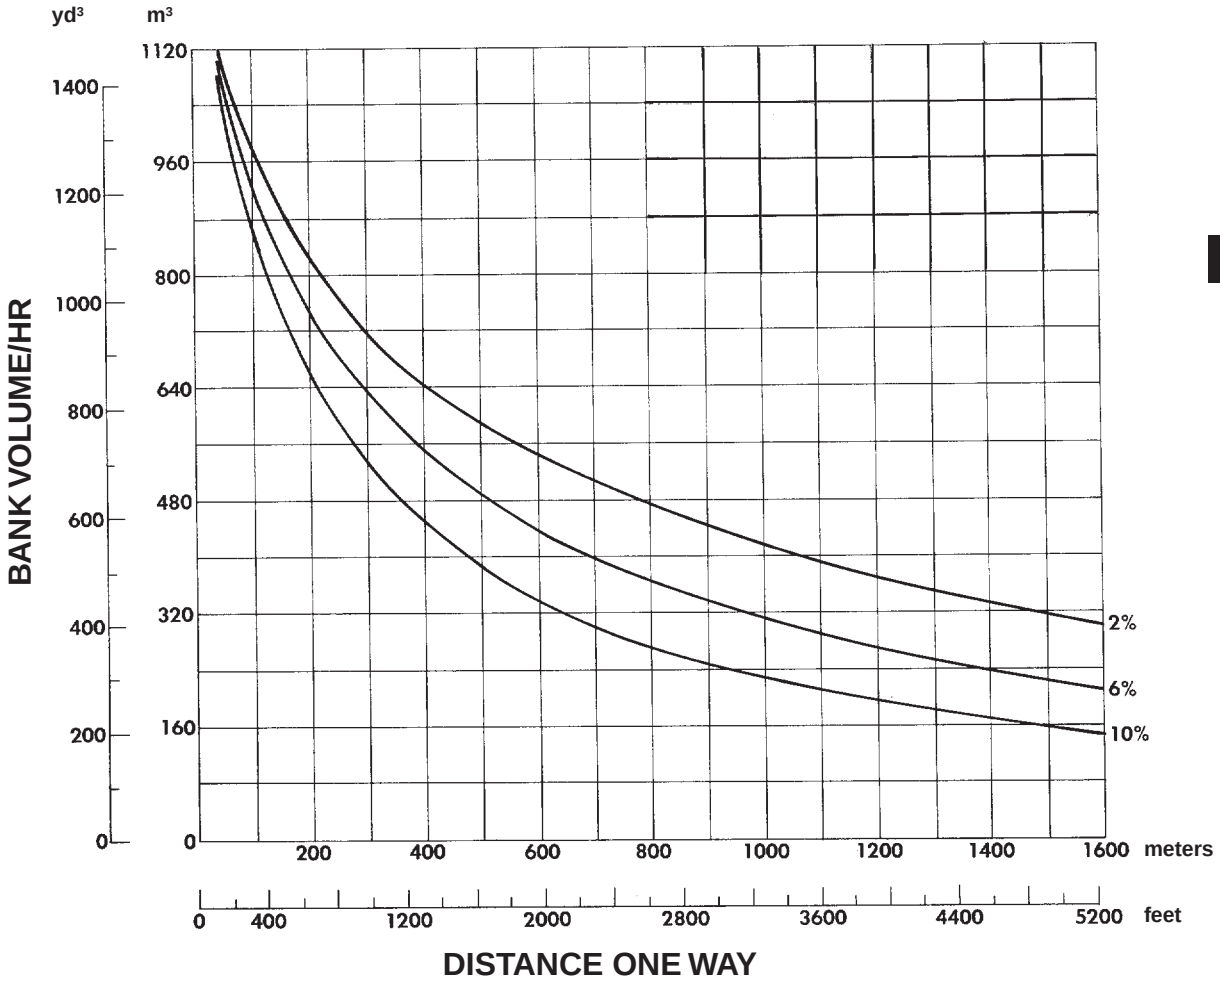
- Material: 1780 kg/m³ (3000 lb/yd³).
- Payload: 47 175 kg, 26.5 Bm³ (104,000 lb, 34.6 BCY).
- Empty weight: 61 130 kg (134,760 lb).
- Fixed time: 1.3 min.



DISTANCE vs. PRODUCTION

CONDITIONS: Flat haul. Percentages shown are rolling resistance only.
100% efficiency (60 min hour).

- Material: 1780 kg/m³ (3000 lb/yd³).
- Payload: 47 175 kg, 26.5 Bm³ (104,000 lb, 34.6 BCY).
- Empty weight: 69 080 kg (152,290 lb).
- Fixed time: 1 min.

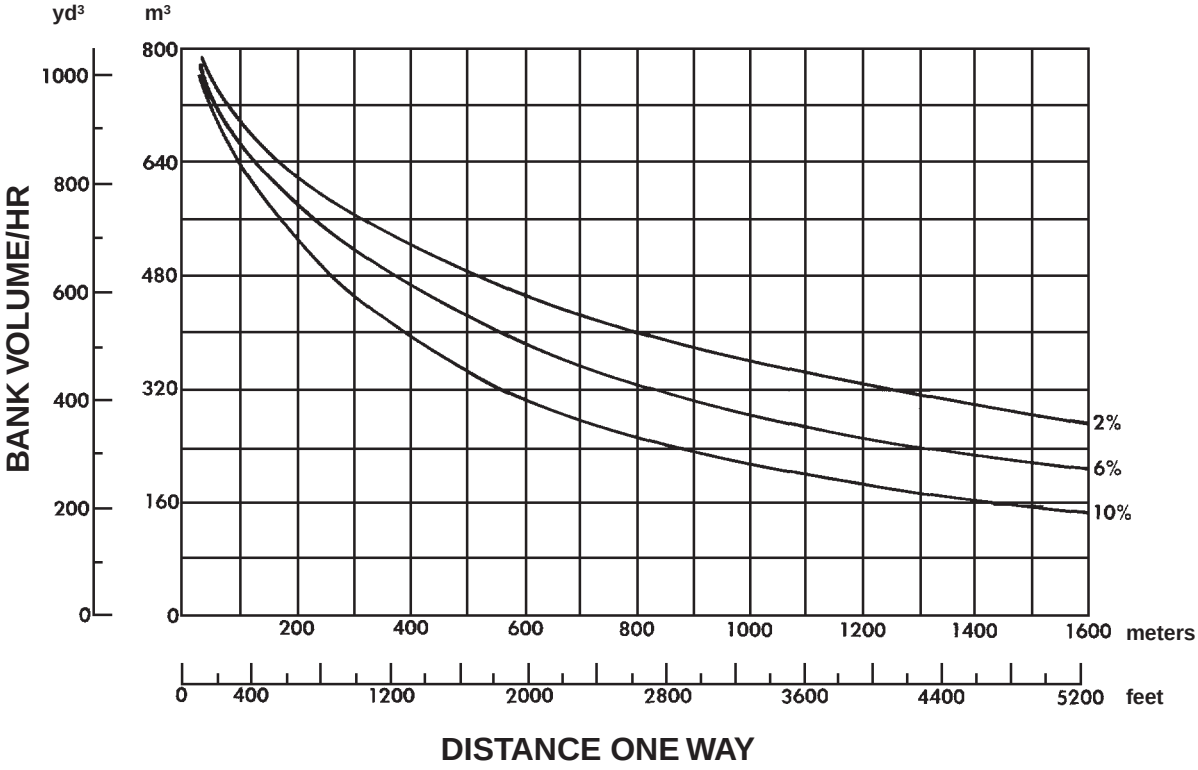


DISTANCE vs. PRODUCTION

CONDITIONS: Flat haul. Percentages shown are rolling resistance only.
100% efficiency (60 min hour).

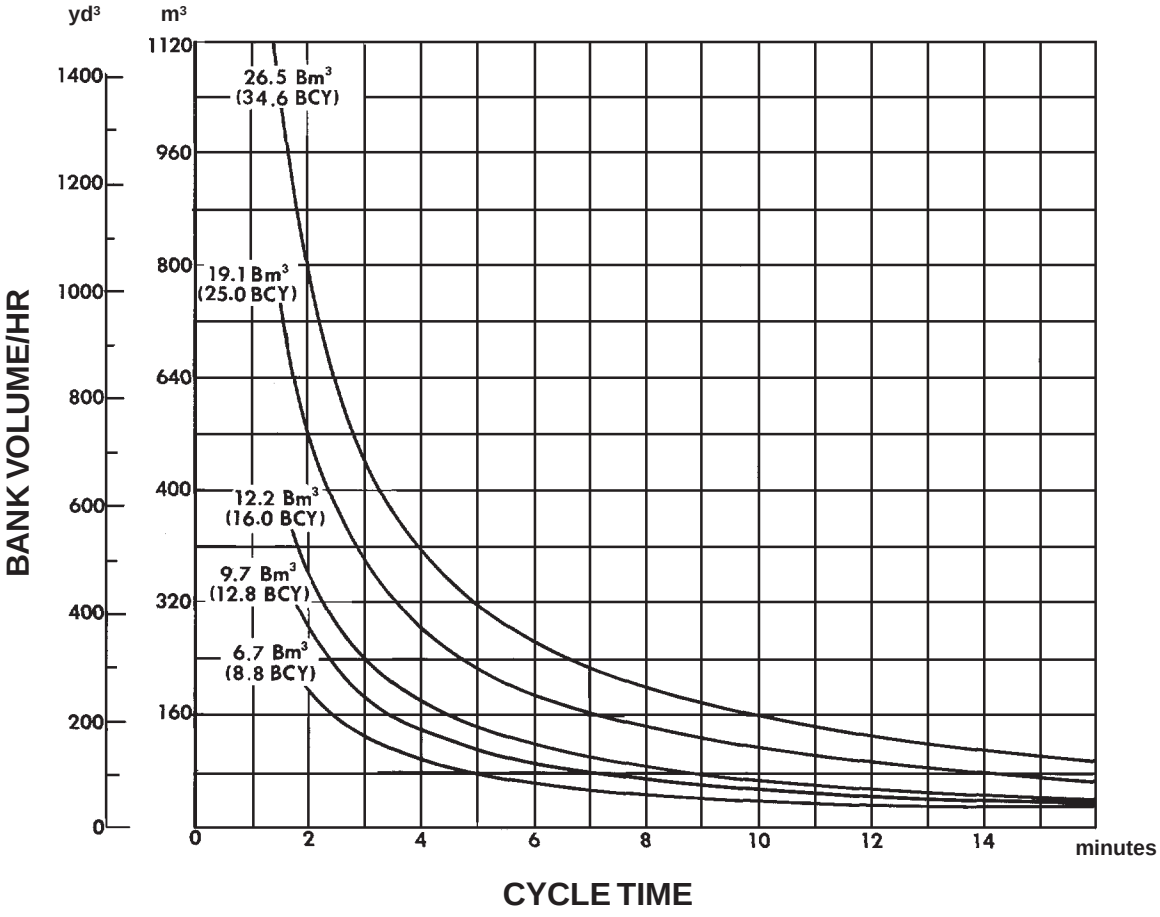
- Material: 1780 kg/m³ (3000 lb/yd³).
- Payload: 47 175 kg, 26.5 Bm³ (104,000 lb, 34.6 BCY).
- Empty weight: 72 860 kg (160,620 lb).
- Fixed time: 1.7 min. (includes loading both units and transfer time).

NOTE: Production estimates apply to one unit. Double these figures for a push-pull pair.



HOURLY PRODUCTION vs. CYCLE TIME

VEHICLE CAPACITY:
611 @ 8.8 Bm³/trip (12 BCY)
613C Series II @ 6.7 Bm³/trip (8.8 BCY)
615C Series II @ 9.7 Bm³/trip (12.8 BCY)
621G, 623G, 627G @ 12.2 Bm³/trip (16 BCY)
631E Series II, 637E Series II @ 19.1 Bm³/trip (25 BCY)
651E, 657E @ 26.5 Bm³/trip (34.6 BCY)



Notes —

CONSTRUCTION & MINING TRUCKS
CONSTRUCTION & MINING TRACTORS

CONTENTS

Features:

- **Caterpillar four-stroke-cycle diesels** … turbocharged, aftercooled, adjustment-free fuel system (direct injection).
- **Electronically-controlled automatic transmission** … speed sensing device automatically shifts transmission between 1st and gear selected by operator.
- **Truck Production Management System (TPMS)** utilizes strut pressure sensors and an on-board microprocessor to determine payload weight, cycle segment times, delay times, actual clock time and date of each cycle.
- **Vital Information Management System (VIMS)** Monitors all vital machine functions. Keeps operator informed of current machine operating conditions, helps reduce downtime and allows service personnel easy access to data for fast accurate diagnosis. VIMS includes Production Management System.
- **Electronic Unit Injection (EUI)** in the 776D-793C and **Hydraulic Electronic Unit Injection (HEUI)** on 769D-775D electronically maintains fuel settings, provides automatic altitude and air filter restriction compensation, automatic variable timing, improved diagnostics and increased fuel efficiency.
- **Oil cooled disc brakes** provide retarding, service, parking, and secondary braking in one sealed, fade-resistant, maintenance-free unit. 769D-777D front brakes are caliper disc, can be switched out of the service system when not needed but activate as part of the secondary system. (Front oil-cooled brakes optional on 777D.) 784C-793C front brakes are oil-cooled disc.
- **Automatic Retarder Control (ARC)** electronically controls braking on grade to maintain faster downhill speeds.
- **Full hydraulic steering,** with front suspension cylinders serving as kingpins.
- **Four independent,** self-contained, oil-pneumatic suspension cylinders absorb loading and road shocks. Wide spacing for stability.
- **A variety of truck bodies** is available to meet your specific needs. Dual slope, flat floor and Mine Specific Design (MSD) for selected models.
- **Quarry trucks** have single-slope flat floor for smooth, metered dumping into crushers or hoppers.
- **Integral Roll Over Protective Structure (ROPS)** cab standard on all models.
- **Separate hydraulic systems** prevents cross contamination.

Tractor Features:

- **Yoke type hitch** oscillates four ways to reduce frame stresses. Rugged turn stops prevent excessive wagon rotation either direction.
- **Rear platform** functions as a power train guard and provides safe, stable work area. Fenders and mud flaps protect from material thrown by tires.

NOTE: Listed features may be standard on some models. Optional on others. Contact your Caterpillar Dealer for specific information.

◀Standard Tire.

USE OF BRAKE PERFORMANCE CURVES

The speed that can be maintained when the machine is descending a grade with retarder applied can be determined from the retarder curves in this section when gross machine weight and total effective grade are known.

Select appropriate grade distance chart that covers total downhill haul; don't break haul into individual segments.

To determine brake performance: Read from gross weight down to the percent effective grade. (Effective grade equals actual % grade *minus* 1% for each 10 kg/metric ton (20 lb./U.S. ton) of rolling resistance.) From this weight-effective grade point, read horizontally to the curve with the highest obtainable speed range, then down to maximum descent speed brakes can safely handle without exceeding cooling capacity. When braking, engine RPM should be maintained at the highest possible level without overspeeding. If cooling oil overheats, reduce ground speed to allow transmission to shift to next lower speed range.

USE OF RIMPULL-SPEED-GRADEABILITY CURVES

(See Wheel Tractor Scraper Section)

Total Effective Grade (or Total Resistance) is grade assistance *minus* rolling resistance.

10 kg/metric ton (20 lb/U.S. ton) = 1% adverse grade.

Example —

With a favorable grade of 20% and rolling resistance of 50 kg/metric ton (100 lb/U.S. ton), find Total Effective Grade.

(50 kg/metric ton) = 50 ÷ 10 = 5% Effective Grade
(from Rolling Resistance)
100 lb/ton = 100 ÷ 20 = 5% Effective Grade
20% (grade) – 5% (resistance) =
15% Total Effective Grade

TYPICAL FIXED TIMES FOR HAULING UNITS

Wait time, delays and operator efficiency all impact cycle time. Minimizing truck exchange time can have a significant effect on productivity.

Fixed time for hauling units include:
1. Truck load time (various with loading tool)
2. Truck maneuver in load area (Truck exchange) (Typically 0.6-0.8 min.)
3. Maneuver and dump time at dump point (Typically 1.0-1.2 min.)

Total cycle time is the combination of:
1. The above fixed time
2. Hauling time (Loaded)
3. Return time (Empty)

Example — assume load tool spots hauler with full bucket

		988F	5130B
cycle times		.60	.45
First pass	(dump time)	.10 min.	.05 min.
2 passes	(full cycle)	.70	.50
3 passes	"	1.30	.95
4 passes	"	1.90	1.40
5 passes	"	2.50	1.85
6 passes	"	3.10	2.30
7 passes	"	3.70	2.75
8 passes	"	4.30	3.20
9 passes	"	4.90	3.65
10 passes	"	5.40	4.10

NOTE: Other sizes of loading tools will have different cycle times. See Wheel Loader section for **average** cycle times for truck loading.

MECHANICAL POWER TRAIN EFFICIENCIES

In selling against electric drive trucks, power train efficiency is an important consideration. To better illustrate the advantages of mechanical drive performance, grade horsepower, power train efficiency, and retarding horsepower should be compared to electric drive trucks.

Grade horsepower can be calculated by the following formula:

Metric

$$\text{grade HP} = \frac{\text{GMW (kg)} \times \text{TR} \times \text{Speed (km/h)}}{273.75}$$

English

$$= \frac{\text{GMW (lb)} \times \text{TR} \times \text{Speed (mph)}}{375}$$

where TR (total resistance) = Rolling resistance + Grade resistance (expressed as a decimal)

English example

700,000 lb GMW, 2% rolling resistance, +8% actual grade at 8.2 mph would require 1530 HP

$$\frac{700{,}000 \times (.02 + .08) \times 8.2}{375} = 1530 \text{ HP}$$

Metric example

317 520 kg GMW, 2% rolling resistance, +8% actual grade at 13.2 km/h would require 1530 HP

$$\frac{317\,520 \times (.02 + .08) \times 13.2}{273.75} = 1530 \text{ HP}$$

We then calculate power train efficiency by dividing grade horsepower by the gross horsepower produced by the engine. Most electric drive trucks run at constant maximum horsepower while under load. Mechanical drive trucks, however, lug the engine and may produce somewhat less than maximum horsepower. Engine power curves must be utilized to determine exact horsepower produced.

Example

$$\frac{\text{1530 grade horsepower}}{\text{1800 gross engine HP}} \times 100 = 85\% \text{ power train efficiency}$$

This exercise illustrates the effect of an efficient mechanical drive power train and should yield results in the 80-85% efficiency range. The same calculation for electric drive trucks would be lower (70-78% range) with a maximum efficiency of about 78% for the most common systems.

Likewise, retarding horsepower being consumed by the retarding system can be calculated by the following formula:

Metric

$$\text{retarding HP} = \frac{\text{GMW (kg)} \times \text{TR} \times \text{Speed (km/h)}}{273.75}$$

English

$$= \frac{\text{GMW (lb)} \times \text{TR} \times \text{Speed (mph)}}{375}$$

where TR (total resistance) = Rolling resistance + Grade resistance (expressed as a decimal)

English example

700,000 lb GMW, 2% rolling resistance, –8% actual grade at 14.7 mph would equate to –1646 HP

$$\frac{700{,}000 \times (.02 - .08) \times 14.7}{375} = 1646 \text{ HP}$$

Metric example

317 520 kg GMW, 2% rolling resistance, –8% actual grade at 23.6 km/h would equate to –1646 HP

$$\frac{317\,520 \times (.02 - .08) \times 23.6}{273.75} = 1646 \text{ HP}$$

This formula is intended for use in determining horsepower being consumed in the field based on field measurements. It is not intended to indicate how fast trucks should be operated on grade. Only job conditions, proper operating procedure, and good judgement should determine safe operating speeds during retarder use.

ARTICULATED TRUCKS

CONTENTS

Features:

- **Caterpillar four-stroke-cycle diesels** … turbocharged and aftercooled, automatic variable timing … parallel porting … direct injection, adjustment-free fuel system … meet all environment regulations effective January 1, 1996.
- **Electronically programmable transmission control on "E" series and 700 series models** … speed sensing device automatically shifts transmission between 1st and gear selected by operator. Control constantly monitors transmission behavior for quick and efficient troubleshooting.
- **Articulating and fully oscillating hitch** … links torsion-free front and rear frames for exceptional maneuverability and traction on uneven terrain. Cast hitch head is robotically-welded to steel alloy forged tube for unmatched strength and durability.
- **Superior suspension systems** … coupled with oscillating hitch, provide smooth ride and excellent traction for prime performance and operator comfort.
- **Wide, long, low dump body design** … for enhanced loadability, material retention and ejection, with excellent machine stability. Low load-over-height allows versatile loader match.
- **High capacity low pressure tires in single formation** … for superior traction and flotation on poor underfoot conditions.
- **High power-to-weight ratio and excellent gradeability** … for high-efficiency and versatile performance.
- **Standard ROPS/FOPS, low sound level cab with tinted safety glass** … for productive and safe operation.

**Rating dependent on optional equipment. Maximum gross weight (empty weight plus payload) should not be exceeded.

A variety of special arrangements are available on a custom product basis. Below is a summary of some of the most popular versions, which are attainable in different model sizes. Please contact your Caterpillar dealer for details and availability.

Refuse Haulers — Very large capacity body arrangements for transport of bulk solid waste, normally used between a transfer station and the face of a sanitary landfill. Arrangement includes large capacity body, extended rear frame and scissors tailgate.

Hydraulically operated steel covers — Available for certain refuse bodies. The covers improve light material retention during transport.

Container Carriers — Allows transport and dump of 6 m (20'0") ISO containers. Usual application is handling containerized waste in landfills. Arrangement includes an extended and reinforced rear frame combined with a special tipping structure.

Transverse Steering — Improves maneuverability in areas with limited space, like tunnels, underground mines and industrial sites. This option allows the truck to turn completely around in a space slightly longer than the truck itself. Available for two axle trucks only.

Heavy Duty Bodies — More robust bodies made with thicker plates and incorporating rock deflectors for tire protection. Increase the vehicle's material appetite and provide longer life in applications involving highly abrasive materials and high impact loading.

Extended Chassis/Water Wagons — Long wheel base chassis, suitable for installation of low center of gravity liquid tanks and other AEM accessories. The extended rear frame permits use of low center of gravity arrangements for added stability. Common applications are haul road dust control and off-road transport of water or fuel. Available for three axle trucks only.

Coal Haulers — Machines configured with large capacity body, extended rear frame and scissors tailgate, for transport of coal. The longer frame helps maintain stability and gives loading height accessible to many loading systems.

Sugar Cane Haulers — May be manufactured by using extended rear frame chassis, adding a sub frame and special tires.

Model	D25D	D30D	725	730	D350E Series II	D400E Series II
Refuse Haulers			X	X	X	X
Container Carriers			X	X		
Transverse Steer	X	X				
Heavy Duty Bodies	X	X				
Extended Chassis			X	X	X	X
Coal Haulers				X	X	X
Sugar Cane Haulers				X		

Use of Ground Pressure Charts

Articulated trucks are normally equipped with wide base radial tires, for improved flotation in poor underfoot conditions. Ground pressure is a function of tire deflection and is also affected by tire penetration. The charts in this section provide a means to estimate ground pressure for 0 and 76 mm (3") tire penetration, when gross vehicle weight, axle load distribution and tire inflation pressure are known. The ground pressure charts on the following pages are based on Michelin XADN tire characteristics. Results may differ for other tread patterns.

Tire load can be calculated by the following formula:

$$\text{Tire load} = \frac{\text{Heaviest Axle Load}}{2}$$

Example

Find the ground pressure generated by a D250E fully loaded with zero and 76 mm (3") tire penetration. The machine is equipped with standard Michelin 23.5R25 tires, inflated to the recommended pressure.

$$\text{D250E Tire Load} = \frac{43\,680 \text{ kg} \times 0.34}{2} = 7426 \text{ kg}$$

$$\text{D250E Tire Load} = \frac{96{,}300 \text{ lb} \times 0.34}{2} = 16{,}371 \text{ lb}$$

From the tire section in this book, inflation pressure for the D250E is 325 kPa = 3.25 bar (47 psi).

From the ground pressure chart for 23.5R25 tires, Ground pressure = 3.1 kg/cm^2 (44 psi) with zero tire penetration.

Ground pressure = 1.4 kg/cm^2 (21 psi) with 76 mm (3") tire penetration.

See the Wheel Tractor Scraper section for explanation on using:

- **Rimpull-Speed-Gradeability Curves**
- **Retarder Curves**
- **Travel Time Charts**

See the Construction and Mining Trucks section for Hauling Unit Fixed Times.

WHEEL TRACTORS
SOIL COMPACTORS

CONTENTS

WHEEL TRACTORS

Features:

- **Reliable Cat power train:** four-stroke-cycle diesel with adjustment-free fuel system ... full power shift with single lever on-the-go shifting.
- **Articulated frame steering** with hinge point midway between front and rear axles ... short turning radius, long wheelbase ... rear and front wheels track at all times.
- **Machine balance** ... equal weight distribution on axles when blading.
- **All dozer functions,** including tip and tilt, hydraulically controlled from operator's seat.

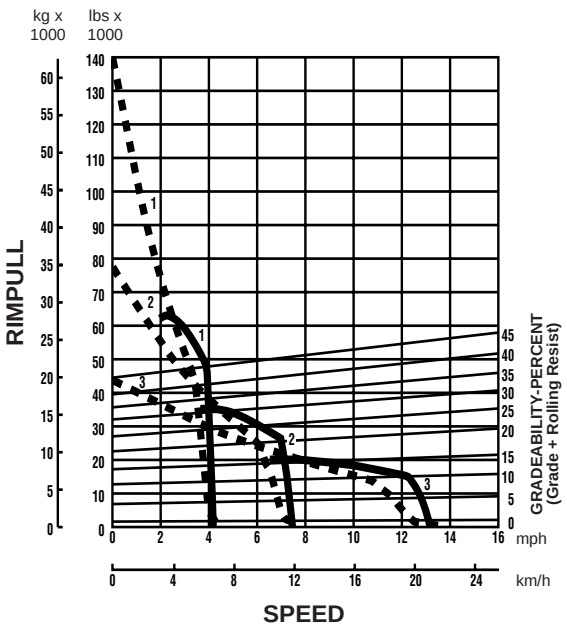
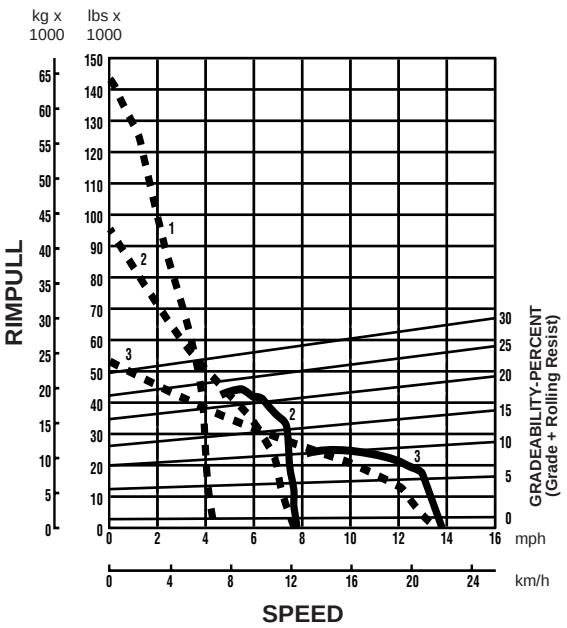
Direct Drive

Usable rimpull depends upon traction and weight of tractor.

844



854G



CONSIDERATIONS IN MACHINE SELECTION

The following factors should be considered when comparing wheels vs. tracks:

Traction

You can figure coefficient of traction, depending on underfoot conditions, from the Table Section in this book.

Wheels — up to 0.65 (in quarry pit with good floor)

Track — up to 0.90 (in soils permitting grouser penetration)

Usable Rimpull = Machine Weight × Coefficient of Traction

Speed

Wheels — travel speeds up to three times higher than track.

Maneuverability

Articulated steering and good visibility give wheel tractors high maneuverability.

Cost

See Owning and Operating Costs section. Tire vs undercarriage costs can often be the deciding factor in selecting wheels or tracks.

Compaction

Ground Pressure:

Wheels — from 241 kPa (35 psi) to 310 kPa (45 psi)

Tracks — from 82 kPa (12 psi) to 97 kPa (14 psi)

Application

Utility … mobility, maneuverability and good speed suit wheel tractors for yard and stockpile work and for clean-up around shovels. Lower maintenance costs may be realized in certain soils that can be highly abrasive to track-type undercarriages.

Coal pile … recommend wheel tractors in this application when following conditions are present:
— Long push distances
— Need for good material spread
— High degree of compaction desired

Production Dozing … a wheel tractor should be considered in the following conditions:
— Long push distances
— Loose soils, little or no rock
— Level or downhill work
— Good underfoot conditions

Pushloading Scrapers … a wheel tractor should be considered in the following conditions:
— Thin scraper cut
— Good underfoot conditions — no rock
— Higher push speeds

Chip and Coal Scoops … may adversely affect performance andor reliability, particularly when adverse grades are encountered.

COUNTERWEIGHTS AND BALLAST

For each specific application, there is a correct machine weight for proper balancing of traction, flotation, mobility and response.

- Low machine weight may increase tire slipping and wear, but improves flotation, mobility and machine response.
- High machine weight increases traction, but decreases mobility and response.

The machine weight is optimum for the operating conditions when wheel slipping barely occurs in the gear being used. Weight distribution under operating conditions should then be approximately equal between the wheels to balance power to each axle.

Application

Lower machine weight is usually required for typical second gear applications, such as fill spreading, stockpiling, road maintenance, towing compactors and shovel cleanup.

Higher machine weight is usually required for such typical first gear applications as heavy dozing and pushloading.

Tire Ballast

A solution of calcium chloride and water is recommended for tire ballast. It has the advantage of low cost with simple quick adjustment to suit working conditions.

TIRE SELECTION & MAINTENANCE

Requirements of traction, flotation and tire life are met by a choice of tire size, tread design and inflation pressure.

Tire Width

For good conditions with little rolling resistance on surfaces where flotation is no problem, a narrower tire may be most economical. It may also be considered in muddy conditions in which the mud can be penetrated to reach firm earth underneath.

Where flotation problems and increased rolling resistance are encountered, wider tires are recommended. The greater contact area and shallower penetration increases flotation.

Tire Size

Larger optional tires will also improve flotation in soft conditions. With larger diameter, rimpull will be reduced which may be desirable to help control wheel spin.

Traction Tread (L-2) tire's penetration ability provides improved traction under some soil conditions.

Rock Tread (L-3) offers improved traction and a more cut resistant rubber compound than the L-2. It provides more rubber at the ground with the same footprint and reduces tire penetration under abrasive conditions. Recommended on any hard smooth surface such as rock, concrete or compacted earth.

Rock — Deep Tread (L-4) provides 50% more tread depth, thicker undertread and sidewall with increased tire life when compared to the L-3 tire. Recommended in rock conditions where sharp fragments cause high tire wear or sudden failures.

Rock — Extra Deep Tread (L-5) provides 150% more tread depth when compared to the L-3 tire. Intended for severe rock conditions with extreme penetration hazards.

Chains should be considered in severe applications where extra tread tires still give unsatisfactory life. Operating costs vary greatly depending on application, underfoot conditions, wheel spin and chain maintenance. Under normal rock operating conditions (short cycle, low average speed and minimum wheel spin) the maximum estimated chain life is about 2000 hours. Before installing chains, carefully weigh their overall economics against known tire costs. Chains are not recommended with new rock extra tread tires but can extend the life of a used tire. Always check clearance around tires before using chains.

Major applications where chains can be considered include:

— stripping rock or rocky soils
— clean-up work around rock loading shovels
— any application where underfoot conditions cause excessive tire wear.

Inflation Pressure

In average operating conditions the recommended inflation pressure prevents excessive deflection and minimizes tire rollover on side slopes.

Over-inflation

Reduces amount of tread contact with ground and provides less flotation. Over-inflation causes center of tread to wear faster and increases the chance of cuts and impact breaks.

Under-inflation

Can cause permanent tire damage in the form of flex breaks, radial cracks, and tread or ply separation. On jobs where wrinkling and bead rollover *are not* apparent, inflation pressure may be reduced to a minimum of:

Bias Ply —	170 kPa (25 psi) on 35/65-33
	170 kPa (25 psi) on 29.5-25
	170 kPa (25 psi) on 26.5-25
	170 kPa (25 psi) on 23.5-25
Radial —	310 kPa (45 psi) on 35/65R 33
	310 kPa (45 psi) on 29.5R 25
	205 kPa (30 psi) on 26.5R 25
	240 kPa (35 psi) on 23.5R 25

Reduced pressure will:

Increase flotation and traction in sand.
Improve envelopment characteristics to reduce sudden death failure on rock jobs.
Provide better tread wear by reducing contact pressure between tire and ground.

Notes —

SOIL COMPACTORS

CONTENTS

Features:

- **Dozing, filling and compacting versatility.**
- **High speed operation** with responsive Caterpillar diesel Engine, single-lever planetary power shift transmission, and all-wheel drive.
- **Articulated frame** makes maneuvering quick and easy. Long wheel base for stability.
- **Wheels with tamping foot design and chevron pattern** give traction, penetration and compaction needed for high production. Foot pattern reversed on trailing drums to prevent overprinting lead drums.
- **Rear drums track front** for double compactive effort. Drum spacing covers mid-axle strip on return pass.
- **Rear axle oscillation** keeps all drums on ground for traction and stability.
- **Cleaner bars** keep drums free of carry over earth regardless of rolling direction. Adjustable, replaceable.
- **Optional fill spreading dozer** has single lever control for raise, lower, hold and float. (Blade tilt optional.)

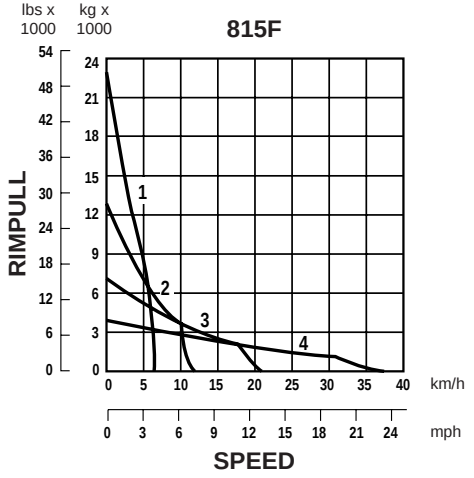
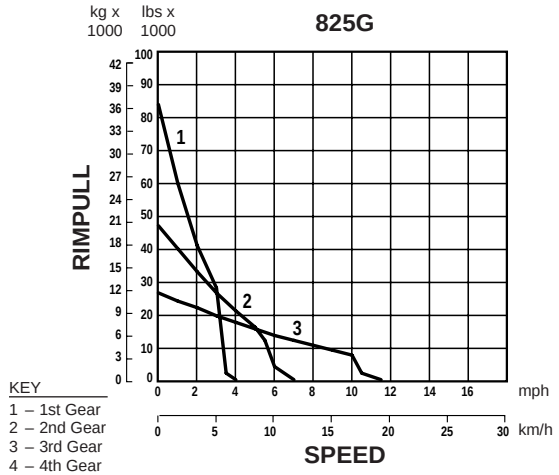
**Height (stripped top) — without ROPS, exhaust, seat back or other easily removed encumbrances.





COMPACTION FUNDAMENTALS

The following discussion applies to soil compaction only. For information on refuse compaction, see Waste Disposal section of this book.

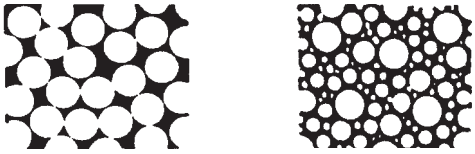
Definition

Compaction is the process of physically densifying or packing the soil … resulting in increased weight per unit volume. It is generally accepted that the strength of a soil can be increased by densification. Three important factors affect compaction.

— Material gradation
— Moisture content
— Compactive effort

Material Gradation — refers to the distribution (% by weight) of the different particle sizes within a given soil sample. A sample is *well-graded* if it contains a good, even distribution of particle sizes. A sample composed of predominantly one size particle, is said to be *poorly-graded*. In terms of compaction, a well-graded soil will compact more easily than one that is poorly-graded. In well-graded material the smaller particles tend to fill the empty spaces between the larger particles, leaving fewer voids after compaction.

MATERIAL GRADATION



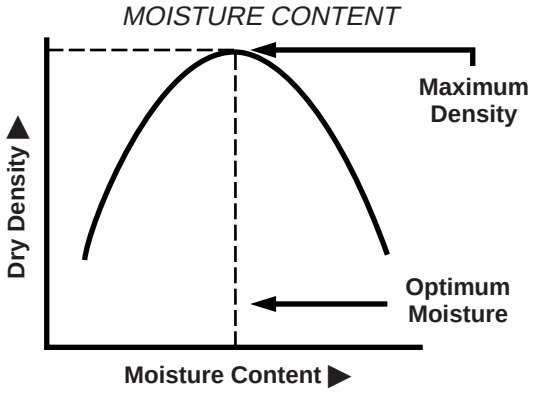
Poorly-graded Well-graded

Moisture Content — or the amount of water present in a soil, is very important to compaction. Water lubricates soil particles thus helping them slide into the most dense position. Water also creates clay particle bonding, giving cohesive materials their sticky qualities.

OPTIMUM MOISTURE

Heavy clay	17.5%
Silty clay	15.0%
Sandy clay	13.0%
Sand	10.0%
Gravel, sand, clay mix (pit run)	7.0%

Experience has shown that it is very difficult, if not impossible, to achieve proper compaction in materials that are too dry or too wet. Soil experts have determined that in practically every soil there is an amount of water, called optimum moisture content, at which it is possible to obtain maximum density with a given amount of compactive effort. The curve below shows this relationship between dry density and moisture content. It is called a compaction curve, moisture-density curve or Proctor curve.



Compactive Effort — refers to the method employed by a compactor to impart energy into the soil to achieve compaction. Compactors are designed to use one or a combination of the following types of compactive effort.

— Static weight (or pressure)
— Kneading action (or manipulation)
— Impact (or sharp blow)
— Vibration (or shaking)

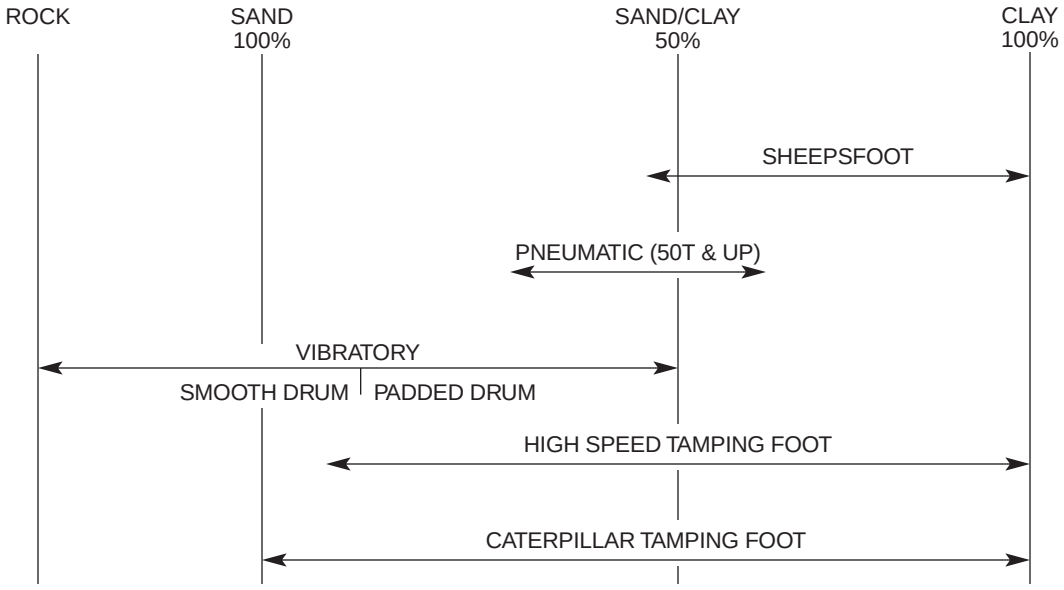
COMPACTOR TYPES

Compaction equipment can be grouped generally into the following classifications:
sheepsfoot
vibratory
pneumatic
high speed tamping foot
chopper wheels (see Landfill Compactor section)

Combinations of these types are also available, such as a vibrating smooth steel drum.

For ease of comparison, the compactors have been placed on the Zones of Application Chart shown below. This chart contains a range of material moistures from 100% clay to 100% sand, plus a rock zone. Each type has been positioned in what is considered to be its most effective and economical zone of application. However, it is not uncommon to find them working out of their zones. Exact positioning of the zones can vary with differing material conditions.

RANGES OF SOIL TYPES FOR SOIL COMPACTION EQUIPMENT



COMPACTOR PRODUCTION

Compactor production is expressed in compacted cubic meters (Cm^3) or compacted cubic yards (CCY) per hour. Material in its natural or bank state is measured in bank cubic meters or yards (Bm^3 or BCY). When it is removed or placed in a fill, it is measured in loose cubic meters or yards (Lm^3 or LCY).

When the loose material is worked into a compacted state, the relationship of *compacted material to bank material* is shown as the shrinkage factor (SF).

$$SF = \frac{\text{Compacted cubic meters } (Cm^3)}{\text{Bank cubic meters } (Bm^3)}$$

$$SF = \frac{\text{Compacted cubic yards (CCY)}}{\text{Bank cubic yards (BCY)}}$$

The construction industry has developed the following formula for use in estimating compactor production. This formula gives the material volume a given machine can compact in a 60-minute hour.

Metric Method

$$Cm^3 = \frac{W \times S \times L}{P}$$

W = Compacted width per pass, in meters. (For Caterpillar Compactors it is recommended that W = Twice the width of one wheel.)

S = Average speed, in kilometers per hour.

L = Compacted thickness of lift, in millimeters.

P = Number of machine passes to achieve compaction **(can only be determined by testing the compacted material density on-the-job).**

English Method

$$CCY/Hr = \frac{W \times S \times L \times 16.3}{P}$$

W = Compacted width per pass, in feet. (For Caterpillar Compactors it is recommended that W = Twice the width of one wheel.)

S = Average speed, in miles per hour.

L = Compacted thickness of lift, in inches.

16.3 = Conversion constant, equals 5280 feet ÷ 12 inches ÷ 27 cubic feet

P = Number of machine passes to achieve compaction **(can only be determined by testing the compacted material density on-the-job).**

Example problem (Metric)

Determine production for an 815F operating under the following conditions:

P = 5, S = 10 km/h, L = 100 mm

Refer to 815F in the production table on the next page. Read down the first column until reaching section for 5 passes. Within this section in the second column, find the speed closest to 10 km/h. Read across this line to the 100 mm compacted lift. Read the production figure given.

Answer: 377 Cm^3/h. (Since the machine's speed of 10 km/h is slightly faster than the 9.5 of the table, production may be interpolated slightly higher — say 395 Cm^3/h.)

Example problem (English)

Determine production for an 825G operating under the following conditions:

P = 4, S = 8 mph, L = 6 inches

Refer to the production estimating table on the next page. This table contains estimates for the 815F and 825G Compactors using various speeds, lift thicknesses and number of passes. These figures were calculated using the formula discussed on this page. The figures represent 100% efficiency. W = Twice the width of one wheel.

In the 825 portion of this table, read down the first column until reaching the section for four passes. Within this section in the second column, find the line for 8 mph. Read across this line to the lift thickness column for 6 inches. Read the production figure given.

Answer: 1444 CCY/hr.

●●●

Notes —

WHEEL LOADERS

CONTENTS

WHEEL LOADERS

WHEEL LOADERS

Features:

- **Caterpillar large displacement, heavy duty diesel engine.**
- **Productive operator environment. Excellent visibility.**
- **Automatic lift and bucket controls.**
- **Adjustable suspension seat and steering column.**
- **Four wheel enclosed wet disc brakes.**
- **Automatic power shift transmissions.** Allows operator to select automatic or manual mode.
- **Hydrostatic drive on 902, 906 and 914G.**
- **Transmission neutralizer switch (938G-980G).**
- **Centerpoint articulated frame steering.**
- **Computerized machine function monitoring.**
- **Command control steering** with integrated transmission controls and electro-hydraulic controls ... 950G-980G.
- **Lock up clutch on 990 and 994D (optional on 988G).**
- **Impeller clutch on 988G, 990, 992G and 994D.**
- **Tilting hood ... 938G-980G.**
- **Brake wear indicator.**
- **Limited slip differentials.**
- **Traction control system ... 938G.**
- **Automatic Ride Control suspension system.** Operator select “on”, “off” or “automatic”.
- **Payload control system.**

Listed features may be standard on some models, optional or unavailable on others. Contact your Caterpillar Dealer for specific information.

*Static tipping load and operating weight are based on standard machine configuration with 20.5-25, 12 PR (L-2) tires, full fuel tank, coolant, lubricants, operator and optional counterweight.

Measured 102 mm **(4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732 JUN92.

***Dump clearance, reach and overall length dimensions for bucket equipped with teeth reflect actual dimensions. SAE J732 JUN92 allows dimensions for buckets with teeth to reflect the dimension using the cutting edge. Caterpillar Inc. uses actual equipped bucket dimensions.

NOTE: Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers (SAE). SAE Standards J732 JUN92 and J742 FEB85 govern loader ratings, denoted in the text by (§).

*Dimensions are measured to the tip of the bucket teeth to provide accurate clearance data. SAE Standards specifies the cutting edge.

**Static tipping load and operating weight shown are based on standard machine configuration with 23.5-R25 XHA (L-3) tires, air conditioning, crankcase guard, power train guard, full fuel tank, lubricants and operator.

***Measured 102 mm **(4")** behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732 JUN92.

NOTE: Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers (SAE). SAE Standards J732 JUN92 and J742 FEB85 govern loader rating, denoted in the text by (§).

*Dimensions are measured to the tip of the bucket teeth to provide accurate clearance data. SAE Standards specifies the cutting edge.

**Static tipping load and operating weight shown are based on standard machine configuration with 23.5-R25 XHA (L-3) tires, air conditioning, crankcase guard, power train guard, full fuel tank, lubricants and operator.

***Measured 102 mm **(4")** behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732 JUN92.

NOTE: Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers (SAE). SAE Standards J732 JUN92 and J742 FEB85 govern loader rating, denoted in the text by (§).

*Dimensions are measured to the tip of the bucket teeth to provide accurate clearance data. SAE Standards specifies the cutting edge.
**Static tipping load and operating weight shown are based on standard machine configuration with 26.5-R25 XHA (L-3) tires, full fuel tank, coolant, lubricants, air conditioning, ride control and operator.
***Measured 102 mm **(4")** behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732 JUN92.
NOTE: Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers (SAE). SAE Standards J732 JUN92 and J742 FEB85 govern loader rating, denoted in the text by (§).

*Dimensions are measured to the tip of the bucket teeth to provide accurate clearance data. SAE Standards specifies the cutting edge.

**Static tipping load and operating weight shown are based on standard machine configuration with 29.5-R25 1-Star (L-3) tires, full fuel tank, coolant, lubricants and operator.

***Measured 102 mm **(4")** behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732 JUN92.

NOTE: Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers (SAE). SAE Standards J732 JUN92 and J742 FEB85 govern loader ratings, denoted in the text by (§).

† Static tipping load and operating weight shown are based on standard machine configuration with 45/65-45, 46 PR (L-5) tires, full fuel tank, cooolant, lubricants and operator.

†† Measured 102 mm **(4")** behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732 JUN92.

NOTE: Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers (SAE). SAE Standards J732 JUN92 and J742 FEB85 govern loader ratings, denoted in the text by (§). Dimensions are also measured to the tip of the bucket teeth to provide accurate clearance data. SAE Standards specifies the cutting edge.

SPECIFICATION DEFINITIONS FOR FRONT END LOADERS

Caterpillar wheel and track loader specifications conform to Society of Automotive Engineers (SAE) definitions as expressed in standards J732 (JUN92), as follows:

Description of Specification Machine

On wheel loaders the tire inflation pressure at which specifications are taken must be described in addition to the current written basic machine description. On track loaders the type of grouser must be specified.

Hydraulic Cycle Times

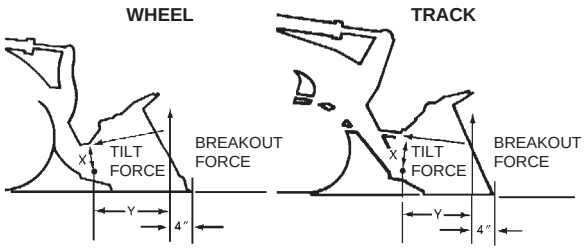
a. "Raise Time" — Time in seconds required to raise the bucket from level position on the ground.
b. "Lower Time" — Time in seconds required to lower the empty bucket from the full height to a level position on the ground.
c. "Dump Time" — Time in seconds required to move the bucket at maximum height from the maximum rollback position to full dump position while dumping the SAE loose material operating load.

Breakout Force

"Breakout force," pounds (and kilonewtons or kilograms) — the maximum sustained vertical upward force exerted 100 mm (4") behind the tip of the bucket cutting edge and achieved through the ability to lift and/or rollback about the specified pivot point under the following conditions:

a. Loader on a hard level surface with transmission in neutral.
b. All brakes released.
c. Unit at standard operating weight — rear of loader not tied down.
d. Bottom of cutting edge parallel to and not more than 20 mm (0.75") above or below the ground line.
e. When bucket circuit is used the pivot point must be specified as the bucket hinge pin, and the unit blocked under the bucket hinge pin pivot point in order to minimize linkage movement.
f. When the lift circuit is used, the pivot point must be specified as the lift arm hinge pin. Wheel loaders shall have front axle blocked to eliminate change in position of pivot pins due to tire deflection.
g. If both circuits are used simultaneously, the dominating pivot point listed in (e) or (f) must be specified.
h. If the circuit used causes the rear of the vehicle to leave the ground, then the vertical force value required to raise the rear of the vehicle is the breakout force.
i. For irregular shaped buckets, the tip of the bucket cutting edge referred to above shall mean the farther forward point of the cutting edge.

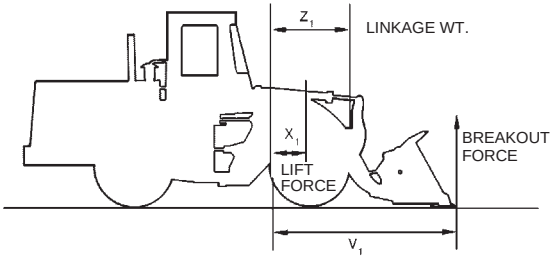
The following are illustrations used (according to provisions of SAE J732 JUN92) to measure Caterpillar Loader breakout forces.

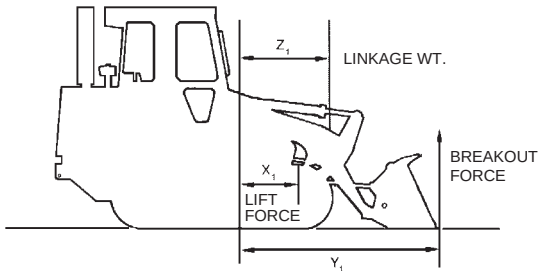


a. Breakout force resulting from rackback:
(Tilt Force) × (Dist. "X") = ("Y" Dist.) × (Breakout Force)

$$\frac{\text{(Tilt Force)} \times \text{(Dist. "X")}}{\text{"Y" Dist.}} = \text{Breakout Force}$$

b. Breakout force resulting from bucket lift:





(Lift Force) × (Dist. "X_1") = ("Y_1" Dist.) × (Breakout Force) + (Linkage Wt.) × (Dist. "Z_1") + (Breakout Force) × (Linkage Mechanical Advantage) "V_1"

or

$$\text{Breakout Force} = \frac{\text{(Lift Force)} \times \text{(Dist. "}X_1\text{")} - \text{(Linkage Wt.)} \times \text{(Dist. "}Z_1\text{")}}{\text{(Dist. "}Y_1\text{")} + \text{(Dist. "}V_1\text{")} \times \text{(Linkage Mech. Advantage)}}$$

Static Tipping Load

The minimum weight at center of gravity of "SAE Rated" load in bucket which will rotate rear of machine to a point where, on track loaders, front rollers are clear of the track and on wheel loaders, rear wheels are clear of the ground under the following conditions:

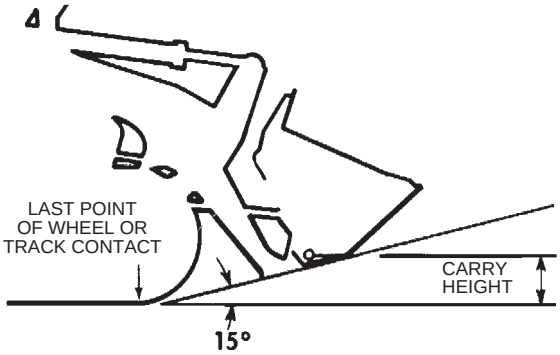
a. Loader on hard level surface and stationary.
b. Unit at standard operating weight.
c. Bucket at maximum rollback position.
d. Load at maximum forward position during raising cycle.
e. For articulated wheel loaders, the test will be run both with frame straight (straight static tipping load) and fully turned to a specific angle (full turn static tipping load).
f. Unit with standard equipment as described in specifications unless otherwise noted under the heading.

Operating Load

In order to comply with SAE standard J818 MAY87, the operating load of Wheel Loaders should not exceed 50% of the full turn Static Tipping load of the machine when equipped with attachments needed for the job. (For track loaders, operating load should not exceed 35% of the Static Tipping load rating.) See "Performance Data" of each machine in this handbook for increases to static tipping load by adding cab, counterweights, ripper-scarifier, etc.

Carry Position

SAE defines carry positions as: "The vertical distance from the ground to the center line of the bucket hinge pin, with the angle of approach at 15°." The sketch below illustrates this definition:



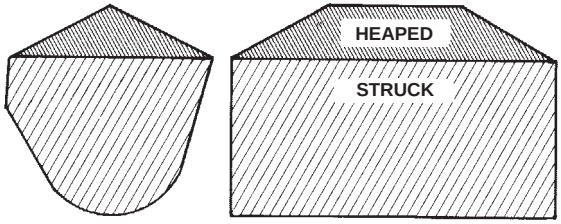
Loader Clearance Circle

SAE J732 JUN92 states that "minimum turning radius (over tire)" and "loader clearance circle" should be given for wheel loaders. Both are given on Caterpillar specification sheets, including loader clearance circles for all available buckets for each machine.

Digging Depth

J732 JUN92 specifies digging depth as "the vertical distance in mm (inches) from the ground line to the bottom of the bucket cutting edge at the lowest position with the bucket cutting edge horizontal."

SAE BUCKET RATING



SAE Bucket Capacities

Struck capacity is that volume contained in a bucket after a load is leveled by drawing a straight edge resting on the cutting edge and the back of the bucket.

Heaped capacity is a struck capacity plus that additional material that would heap on the struck load at a 2:1 angle of repose with the struck line parallel to the ground.

SAE J742 (FEB85) specifies that the addition of any auxiliary spill guard to protect against spillage which might injure the operator will not be included in bucket capacity ratings. Buckets with irregular shaped cutting edges (vee edge) the strike plane should be drawn at one-third the distance of the protruding portion of the cutting edge. Caterpillar rock buckets are built with integral see-through rock guards. Caterpillar light material buckets come standard with bolt-on edges. These features which add to actual bucket capacity are included in published ratings.

Dump Height

SAE J732 JUN92 specifies that dump height is the vertical distance from the ground to the lowest point of the cutting edge with the bucket hinge pin at maximum height and the bucket at a 45° dump angle. Dump angle is the angle in degrees that the longest flat section of the inside bottom of the bucket will rotate below horizontal.

SELECTING A MACHINE

Steps in selecting the proper size loader:

1. Determine production required or desired.
2. Determine loader cycle time and cycles per hour. A machine size must be assumed to select a basic cycle time.
3. Determine required payload per cycle in loose cubic yards and pounds (meters and kilograms).
4. Determine bucket size needed.
5. Make machine selection using bucket size and payload as criteria to meet production requirements.
6. Compare the loader cycle time used in calculations to the cycle time of the machine selected. If there is a difference, rework the process beginning at step 2.

1. Production Required

The production required of a wheel or track loader should be slightly greater than the production capability of the other critical units in the earth or material moving system. For example, if a hopper can handle 300 tons per hour, a loader capable of slightly more than 300 tons should be used. Required production should be carefully calculated so the proper machine and bucket selections are made.

2. Loader Cycle Times

When hauling loose granular material on a hard smooth operating surface, a .45-.55 minute basic cycle time is considered reasonable for Caterpillar articulated loaders with a competent operator. This includes load, dump, four reversals of direction, full cycle of hydraulics and minimum travel.

Material type, pile height, and other factors may improve or reduce production, and should be added to or subtracted from the basic cycle time when applicable.

When hauls are involved, obtain the haul and return portion of the cycle from the estimated travel chart (this section). Add the haul and return times to the estimated basic cycle time to obtain total cycle time.

CYCLE TIME FACTORS

A basic cycle time (Load, Dump, Maneuver) of .45-.55 minutes is average for an articulated loader [the basic cycle for large loaders, 3 m^3 (4 yd^3) and up, can be slightly longer], but variations can be anticipated in the field. The following values for many variable elements are based on normal operations. Adding or subtracting any of the variable times will give the total basic cycle time.

	Minutes added (+) or Subtracted (–) From Basic Cycle
Machine	
— Material handler	–.05
Materials	
— Mixed	+.02
— Up to 3 mm (1/8 in)	+.02
— 3 mm (1/8 in) to 20 mm (3/4 in)	–.02
— 20 mm (3/4 in) to 150 mm (6 in)	.00
— 150 mm (6 in) and over	+.03 and Up
— Bank or broken	+.04 and Up
Pile	
— Conveyor or Dozer piled 3 m (10 ft) and up	.00
— Conveyor or Dozer piled 3 m (10 ft) or less	+.01
— Dumped by truck	+.02
Miscellaneous	
— Common ownership of trucks and loaders	Up to –.04
— Independently owned trucks	Up to +.04
— Constant operation	Up to –.04
— Inconsistent operation	Up to +.04
— Small target	Up to +.04
— Fragile target	Up to +.05

Using actual job conditions and the above factors, total cycle time can be estimated. Convert total cycle time to cycles per hour.

$$\textit{Cycles per hour at 100\% Efficiency} = \frac{\textit{60 min}}{\textit{Total Cycle Time in Minutes}}$$

Job efficiency is an important factor in machine selection. Efficiency is the actual number of minutes worked during an hour. Job efficiency accounts for bathroom breaks and other work interruptions.

$$\text{Cycles per hour at 50 minutes per hour (83\% efficiency)} = \text{Cycles per hour at 100\% efficiency} \times \frac{\text{50 min actual work time}}{\text{60 min hour}}$$

TRUCK LOADING

Average loader cycle times

914G-962G	0.45-0.50 min
966G-980G	0.50-0.55 min
988F-990	0.55-0.60 min
992G-994D	0.60-0.70 min

3. Required Payload Per Cycle

Required payload per cycle is determined by dividing required hourly production by the number of cycles per hour.

4. Bucket Selection

After required payload per cycle has been calculated, the payload should be divided by the loose cubic yard (meter) material weight to determine number of loose cubic yards (meters) required per cycle.

The bulk of material handled does not weigh 1800 kg/m^3 (3000 lb/yd^3), so a reasonable knowledge of material weight is necessary for accurate production estimates. The Tables Section has average weight for certain materials when actual weights are not known.

The percentage of rated capacity a bucket carries in various materials is estimated below. The bucket size required to handle the required volume per cycle is found with the aid of the percentage of rated bucket capacity called "Bucket Fill Factor."

The bucket size needed is determined by dividing loose cubic meters (or yards) required per cycle by the bucket fill factor.

$$\textit{Bucket size} = \frac{\textit{Volume Required/Cycle}}{\textit{Bucket Fill Factor}}$$

BUCKET FILL FACTORS

The following indicates the approximate amounts of material as a percent of rated bucket capacity which will actually be delivered per bucket per cycle. This is known as "Bucket Fill Factor."

Loose Material	Fill factor
Mixed moist aggregates	95-100%
Uniform aggregates up to 3 mm (1/8 in)	95-100
3 mm (1/8 in) to 9 mm (3/8 in)	90-95
12 mm (1/2 in) to 20 mm (3/4 in)	85-90
24 mm (1.0 in) and over	85-90

Blasted Rock

Well blasted	80-95%
Average	75-90
Poor	60-75

Other

Rock dirt mixtures	100-120%
Moist loam	100-110
Soil, boulders, roots	80-100
Cemented materials	85-95

NOTE: Fill factors on wheel loaders are affected by bucket penetration, breakout force, rackback angle, bucket profile and ground engaging tools such as bucket teeth or bolt-on replaceable cutting edges.

Example:

12 mm (1/2 in) material and 3 m^3 (4 yd^3) bucket.
.90 × 3 m^3 = 2.75 Loose m^3 delivered per cycle.
.90 × 4 yd^3 = 3.6 Loose yd^3 delivered per cycle.

NOTE: Check the static tipping load on the specific machine to determine if bucket load is in fact a safe operating load.

Bucket Selection

$$\textit{Tons Required/Cycle} = \frac{\textit{Tons Required/Hour}}{\textit{CyclesHour}}$$

$$\textit{Kg (Pounds) Required/Cycle} = \textit{Tons Required/Cycle} \times \textit{907 kg (2000 lb)}$$

$$\textit{Volume Required/Cycle} = \frac{\textit{kg (Pounds) Cycle}}{\textit{Material Weight } kg/m^3 \textit{ (lb/yd}^3\textit{)}}$$

Always select a machine with a greater capacity than the calculated required operating capacity. For most applications, payload above recommended and excessive counterweight can hinder machine performance and reduce dynamic stability and machine life.

For optimum performance in fast cycling situations such as truck loading, operating loads should not exceed the recommended capacity. To provide extra stability, calcium chloride ($CaCl_2$) ballast may be desired when operating at recommended operating load, see SAE Loader rating pages in this section. For specific stability data and optional tire sizes, see the "Performance Data" pages in this section.

When selecting special application buckets, such as multi-purpose and side dump the additional bucket weight must be deducted from recommended capacity.

Specific circumstances may involve other conditions which would also affect loader capacity. Because of the greatly varied applications and conditions, your Caterpillar dealer should be contacted for guidance.

Example problem:

JOB CONDITIONS

Application	Truck loading
Production Required	450 metric ton (496 Tons) per hour
Material	9 mm (3/8") gravel in 6 m (20 ft) high stockpile
Density	1660 kg/m^3 (2800 lb/yd^3)

Trucks are 6-9 m^3 (8-12 yd^3) capacity and are owned by three contractors. Loading is constant. Hard level surface for loader maneuvering.

1. *PRODUCTION REQUIRED:* Given

2. *CYCLE TIME:* Assume loader size between 914G and 962G for initial choice of basic cycle.

(Refer to Cycle Time Factors in this section)

Independent trucks	.04 min
Basic Cycle	.50 min
Material	–.02 min
Independent trucks	+.04 min
Constant operation	–.02 min
Total Cycle	.50 min

NOTE: Load and carry times not required in total cycle.

$$\text{Cycles/hr at 83\% efficiency} = 120 \text{ cycles/hr} \times \frac{\text{50 min actual work time}}{\text{60 min per hr}}$$

$$= 100 \text{ cycles/hr}$$

3. *VOLUME REQUIRED PER CYCLE*
(Density in tons)
Density in this example was given. When not given, refer to Tables Section to obtain an estimated density for the material being handled.

$$\textit{Metric:}\ \frac{1660 \text{ kg/m}^3}{1000 \text{ kg/ton}} = 1.66 \text{ ton/m}^3$$

$$\textit{English:}\ \frac{2800 \text{ lb/yd}^3}{2000 \text{ lb/ton}} = 1.4 \text{ tons/yd}^3$$

Production Rate Required

Metric: $\frac{450 \text{ tons/hr}}{1.66 \text{ tons/m}^3} = 271 \text{ m}^3\text{/hr}$

English: $\frac{496 \text{ tons/hr}}{1.4 \text{ tons/yd}^3} = 354 \text{ yd}^3\text{/hr}$

Volume Required per Cycle

Metric: $\frac{271 \text{ m}^3\text{/hr}}{100 \text{ cycles/hr}} = 2.71 \text{ m}^3\text{/cycle}$

English: $\frac{354 \text{ yd}^3\text{/hr}}{100 \text{ cycles/hr}} = 3.54 \text{ yd}^3\text{/cycle}$

4. *DETERMINE BUCKET SIZE*

BUCKET FILL FACTOR

The volume of material required per cycle has been determined. Because of varying material fill factors, buckets do not always carry their rated load, a larger capacity bucket may be needed to carry the volume required. For fill factors, refer to Bucket Fill Factor Chart in this section.

Rated Bucket Capacity Required (Heaped)

$\frac{2.71 \text{ m}^3\text{/cycle}}{.95 \text{ fill factor}} = 2.85 \text{ m}^3$

$\frac{3.54 \text{ yd}^3\text{/cycle}}{.95 \text{ fill factor}} = 3.73 \text{ yd}^3$

A 2.9 m^3 (3.75 yd^3) bucket would provide the required capacity.

5. *MACHINE SELECTION*

The bucket size required and material density lead to the choice of a 950G with a 2.9 m^3 (3.75 yd^3) General Purpose Bucket (see bucket selection guide pages which follow.)

Finally, SAE payload criteria must be satisfied as follows:

The required operating capacity must not exceed one-half of the full turn static tipping load of the loader as equipped with a specific bucket.

The required operating capacity of the machine is determined by the volume the machine will carry per load times the density.

2.9 m^3 × 1660 kg/m^3 = 4814 kg
(3.75 yd^3 × 2800 lb/yd^3 = 10,500 lb)

One half of full turn static tipping load for the 950G with a 2.9 m^3 (3.75 yd^3) General Purpose Bucket is 5410 kg (11,925 lb). SAE criteria is satisfied.

●●●

An Alternative Method of Machine Selection

Another method of selecting the right Wheel Loader and bucket to meet production requirements is by use of the nomographs on the following pages. The method is quicker and easier than the preceding example because it does not require as many calculations, yet the accuracy is about the same within the normal limits of input data.

Be careful when entering and reading data from the nomographs because some scales increase from bottom to top, while others are the reverse. Do not be overly concerned with the precision as affected by pencil line width or reading to the hundredth of a m^3 (yd^3). Remember that bucket fill factor, material density and cycle time are at best close estimates.

Example problem:

A Wheel Loader must produce 230 m^3 (300 yd^3) per hour in a truck loading application. Estimated cycle time is .6 minutes, working 45 minutes per hour. Bucket fill factor is 95% and material density is 1780 kg/m^3 (3000 lb/yd^3).

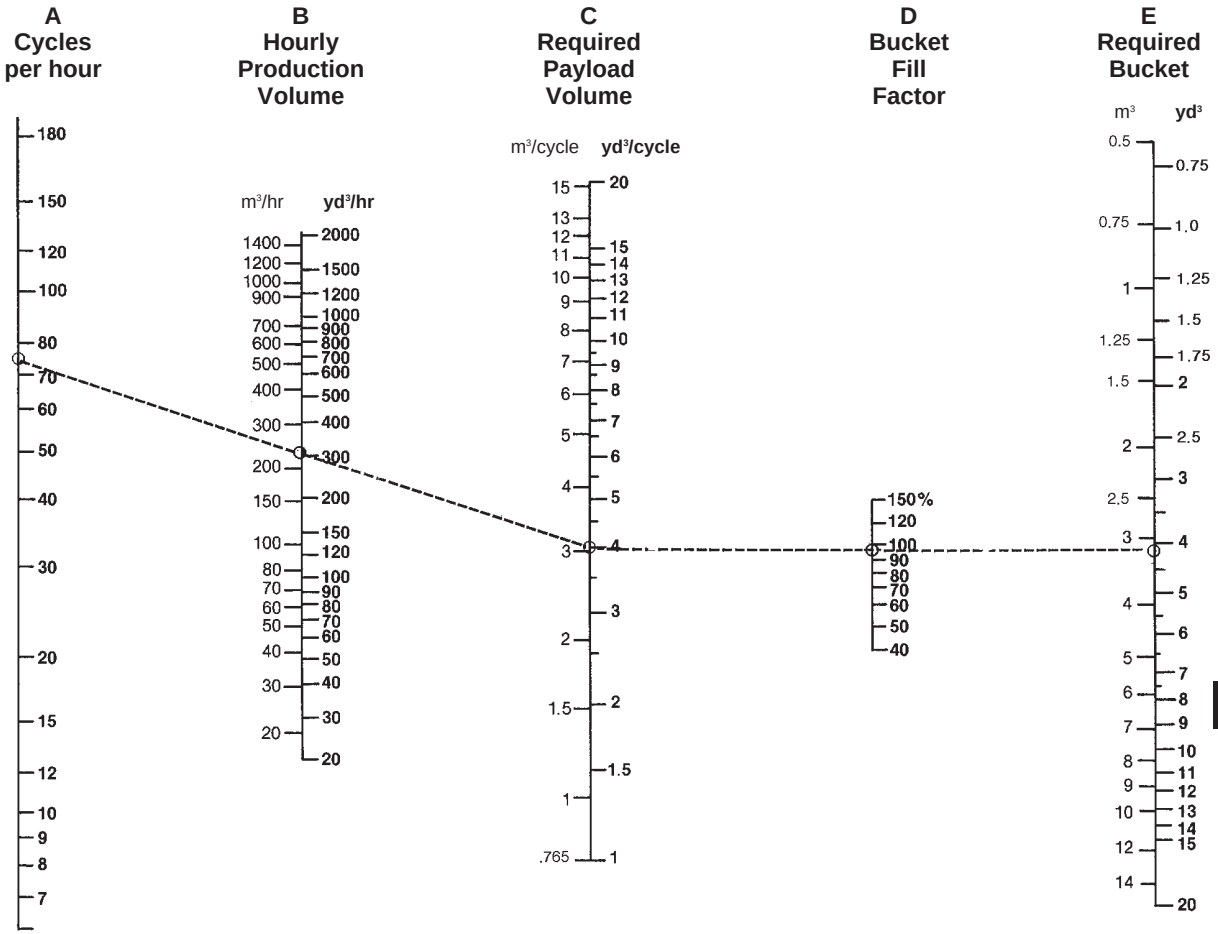
Determine bucket size and machine model.

Solution:

At full efficiency, the Wheel Loader will cycle 100 times per hour. Since only an average of 45 minutes are available, only 75 cycles will be completed.

Starting on Scale A at 75 cycles per hour draw a straight line intersecting 230 m^3/hr (300 yd^3/hr) on Scale B and extending it on to Scale C giving 3 m^3/cycle (4 yd^3/cycle) required payload. Follow solution steps 1-10.

1. Enter required hourly production on Scale B 230 m^3/hr (300 yd^3/hr).
2. Enter cycles per hour on Scale A (60 ÷ .6 = 100 × .75 = 75 cycles/hr).
3. Connect A thru B to C. This shows a required payload of 3 m^3 (4 yd^3) per cycle.
4. Enter estimated bucket fill factor on Scale D (0.95).
5. Connect C thru Scale D to E for required bucket size 3 m^3 (4 yd^3).
6. Transfer cycles per hour Scale A and required payload Scale C to the following page.



7. Enter material density on Scale F 1780 kg/m³ (3000 lb/yd³).
8. Connect C thru Scale F to Scale G to give payload weight per cycle 5300 kg (11,500 lb).
9. Compare Scale G quantity 5300 kg (11,500 lb) with recommended machine working range listed on the following bucket selection pages. Operating capacity for the 950G with 3.1 m³ (4 yd³) bucket is dependent on material density and bucket capacity (see bucket selection pages that follow).
10. For hourly tonnage, draw a straight line from Scale G thru Scale A to Scale I 400 metric tons (450 U.S. tons).

NOTE: List is not all-inclusive. Contact your Caterpillar Dealer for special attachment needs.

*Requires IT compatible quick coupler.

Notes —

TRACK LOADERS

CONTENTS

Features of 933C and 939C:

- **Hydrostatic drive train** offers infinitely variable speeds, fast acceleration, dynamic hydrostatic braking, superior maneuverability and excellent controllability.

Features of 953C-973C:

- **Rear engine location** provides natural stability as a "working" counterweight, excellent visibility and good weight to horsepower ratio.
- **Electronic hydrostatic drive train with pedal steering** offers independent control of each track. Power turns, counterrotation infinitely variable speeds, and fast acceleration for increased maneuverability and production.
- **Variable displacement pump and motors** provide excellent efficiency and controlability.
- **Z-bar linkage** provides increased breakout force, fewer grease points and fast dump speed.
- **Special arrangements** including S-LGP, Waste Handling and Steel Mill (973C) are available to tailor the machine to specific applications.
- **C-Series cab and controls** offer a high level of operator comfort. Low sound levels, large interior volume, two large storage compartments, fully adjustable arm rests, ergonomic controls, Cat contour seat and excellent visibility.
- **Computerized Monitoring System (CMS)** provides operator with gauges and other information, alerts of occuring or impending problems, registers fault codes and acts as an extended diagnostic system.
- **Pilot operated hydraulic controls** offer low lever forces for precise, consistent bucket control and reduces operator fatigue.
- **Implement power requirements** have priority over track requirements automatically … full implement power available for maximum breakout force and simultaneous lift and dump capability results in fast loading and cycle times.
- **Oscillating track roller frames** decrease ground shock, increase machine stability and improve traction.

Features common to all models:

- **Unmatched versatility** — excavates, loads, dozes, grades, clears, strips, backfills in all underfoot conditions including those that could damage tires.
- **Sound-suppressed, air-pressurized, resiliently mounted ROPS cab** for superior working environment.
- **Sealed and Lubricated Track** reduces wear and maintenance expense. Various track shoes and chains are available including Rotating Bushing Track on some models.
- **Sealed loader linkage** extends lubrication intervals and reduces maintenance time.
- **Automatic bucket controls** let bucket rise to pre-set dumping height and return to pre-set digging angle for fast cycle time.
- **General Purpose and Multi-Purpose** buckets, quick couplers and many other work tools are available to increase versatility.
- **Radial rippers** are Multishank with wide beam coverage for utility ripping close to walls, footings and embankments. Five shanks available for 933C and 939C. Three shanks for 953C, 963C and 973C.

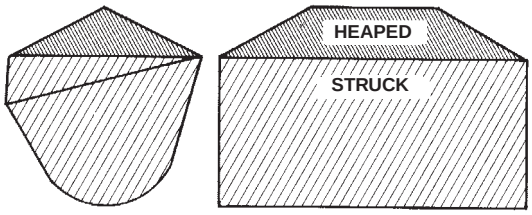
SAE BUCKET RATING



SAE Bucket Capacities

Struck capacity is that volume contained in a bucket after a load is leveled by drawing a straight edge resting on the cutting edge and the back of the bucket.

Heaped capacity is a struck capacity *plus* that additional material that would heap on the struck load at a 2:1 angle of repose with the struck line parallel to the ground.

SAE J742 (Oct. 79) specifies that the addition of any auxiliary spill guard to protect against spillage of material which might injure the operator will not be included in bucket capacity ratings. Buckets with irregular shaped cutting edges (vee edge) the strike plane should be drawn at one-third the distance of the protruding portion of the cutting edge. Caterpillar rock buckets are built with integral see-through rock guards. Caterpillar light material buckets come standard with bolt-on edges. These features which add to actual bucket capacity are included in published ratings.

Dump Height

SAE J732 JUN92 specifies that dump height is the vertical distance from the ground to the lowest point of the cutting edge with the bucket hinge pin at maximum height and the bucket at a 45° dump angle. Dump angle is the angle in degrees that the longest flat section of the inside bottom of the bucket will rotate below horizontal.

Static Tipping Load

The minimum weight at center of gravity of "SAE Rated" load in bucket which will rotate rear of machine to a point where, on track loaders, front rollers are clear of the track under the following conditions:

a. Loader on hard level surface and stationary.
b. Unit at standard operating weight.
c. Bucket at maximum rollback position.
d. Load at maximum forward position during raising cycle.
e. Unit with standard equipment as described in specifications unless otherwise noted under the heading.

Operating Load

In order to comply with SAE standard J818 MAY87, the operating load for track loaders should not exceed 35% of the Static Tipping load rating. See "Performance Data" of each machine in this handbook for increases to static tipping load by adding cab, counterweights, ripper-scarifier, etc.

SELECTING A MACHINE

Steps in selecting the proper size loader:

1. Determine production required or desired.
2. Determine loader cycle time and cycles per hour. A machine size must be assumed to select a basic cycle time.
3. Determine required payload per cycle in loose cubic yards and pounds (meters and kilograms).
4. Determine bucket size needed.
5. Make machine selection using bucket size and payload as criteria to meet production requirements.
6. Compare the loader cycle time used in calculations to the cycle time of the machine selected. If there is a difference, rework the process beginning at step 2.

1. Production Required

The production required of a track loader should be slightly greater than the production capability of the other critical units in the earth or material moving system. For example, if a hopper can handle 300 tons per hour, a loader capable of slightly more than 300 tons should be used. Required production should be carefully calculated so the proper machine and bucket selections are made.

2. Loader Cycle Times

Material type, pile height, and other factors may improve or reduce production, and should be added to or subtracted from the basic cycle time when applicable.

When hauls are involved, obtain haul and return portions of the cycle from the estimated travel chart (this section). Add the haul and return times to the estimated basic cycle time to obtain total cycle time.

CYCLE TIME FACTORS

A basic cycle time (Load, Dump, Maneuver) of 0.25-0.35 minutes is average for a track loader [the basic cycle for large track loaders, 2 m^3 (2.6 yd^3) and up, can be slightly longer], but variations can be authenticated in the field. The following values for many variable elements are based on normal operations. Adding or subtracting any of the variable times will give the total basic cycle time.

Estimating Cycle Time

Cycle time of a track loader needs to be determined to find loads per hour. Total cycle time includes the following segments:

Load Time + Maneuver Time + Travel Time + Dump Time

Load Time —

Material	Minutes
Uniform aggregates	0.03-0.05
Moist mixed aggregates	0.03-0.06
Moist loam	0.03-0.07
Soil, boulders, roots	0.04-0.20
Cemented materials	0.05-0.20

Maneuver Time — includes basic travel, four changes of direction and turning time, and will be about 0.20 minutes with a competent operator.

Travel Time — in a load and carry operation is comprised of haul and return times which can be determined by the travel charts in this section.

Dump Time — is dictated by the size and strength of the dump target and varies from 0.00 to 0.10 minutes. Typical dump times into highway trucks are from 0.04 to 0.07 minutes.

NOTE: When comparing hydrostatic track loaders with former power shift models (using the production estimating method) two factors must be considered: (1) The hydrostatic track loaders on the average outcycle power shift models by up to 10 percent due to faster machine speed and easier operation. (2) Larger, rear engine hydrostatic track loaders incorporate Z-bar linkage, which provides substantially better bucket fill factors. The degree to which each factor affects estimated production should be left to the user's judgment depending on the particular job application and conditions.

Example: Moist loam is being excavated from a bank and loaded into trucks.

	Minutes
Load — moist loam	0.05
Maneuver Time	0.20
Travel — none required	0.00
Dump	0.05
Total Cycle	0.30 min. or 200 cycles per 60 min. hour

	Minutes added (+) or Subtracted (–) From Basic Cycle
Materials	
— Mixed	+0.02
— Up to 3 mm (1/8 in)	+0.02
— 3 mm (1/8 in) to 20 mm (3/4 in)	–0.02
— 20 mm (3/4 in) to 150 mm (6 in)	0.00
— 150 mm (6 in) and over	+0.03 and Up
— Bank or broken	+0.04 and Up
Pile	
— Conveyor or Dozer piled 3 m (10 ft) and up	0.00
— Conveyor or Dozer piled 3 m (10 ft) or less	+0.01
— Dumped by truck	+0.02
Miscellaneous	
— Common ownership of trucks and loaders	Up to –0.04
— Independently owned trucks	Up to +0.04
— Constant operation	Up to –0.04
— Inconsistent operation	Up to +0.04
— Small target	Up to +0.04
— Fragile target	Up to +0.05

Using actual job conditions and the above factors, total cycle time can be estimated. Convert total cycle time to cycles per hour.

$$\textit{Cycles per hour at 100\% Efficiency} = \frac{\textit{60 Min}}{\textit{Total Cycle Time in Minutes}}$$

Job efficiency is an important factor in machine selection. Efficiency is the actual number of minutes worked during an hour. Job efficiency accounts for operator breaks, and other work interruptions. See "Efficiency Considerations" page 14-18.

Bucket Fill Factors

The following indicates the approximate amounts of material as a percent of rated bucket capacity which will actually be delivered per bucket per cycle. This is known as "Bucket Fill Factor."

Loose Material	Fill Factor
Mixed Moist Aggregates	95-110%
Uniform Aggregates	
up to 3 mm (1/8 in)	95-110
3 mm-9 mm (1/8 in-3/8 in)	90-110
12 mm-20 mm (1/2 in-3/4 in)	90-110
24 mm and over (1 in)	90-110
Blasted Rock	
Well	80-95%
Average	75-90
Poor	60-75
Other	
Rock Dirt Mixtures	100-120%
Moist Loam	100-120
Soil, Boulders, Roots	80-100
Cemented Materials	85-100

Fill factors on track loaders are affected by bucket penetration, breakout force, rackback angle, bucket profile and ground engaging tools such as bucket teeth and segments or bolt-on replaceable cutting edges.

GENERAL PURPOSE BUCKET W/TEETH & SEGMENTS MAXIMUM OPERATING CAPACITIES

MODEL	GENERAL PURPOSE BUCKET SIZE m^3	yd^3	MAXIMUM OPERATING CAPACITY kg	lb
933C	1.0	**1.3**	1770	**3900**
939C	1.15	**1.5**	2040	**4500**
953C	1.85	**2.4**	3340	**7370**
963C	2.45	**3.2**	4550	**10,030**
973C	3.2	**4.2**	6750	**14,870**

LOADER PRODUCTION

Loader production equals quantity of material the bucket carries per load × number of bucket loads per hour.

Estimating Bucket Load

The quantity of material in a loader bucket is estimated by two methods, depending on whether the material being loaded is in a loose or bank state.

1. When the material is loose, as in stockpile loading, the bucket load is estimated in loose meters (or cubic yards) by a Bucket Fill Factor (see Tables Section or chart following this discussion). The quantity of material is determined as follows:
   Rated Bucket Capacity × Bucket Fill Factor = Bucket Payload in Loose m^3 (yd^3)

   For example, a 973 with a 3.2 m^3 (4.2 yd^3) General Purpose bucket loading moist loam material will carry:
   3.2 m^3 × 1.15 = 3.68 loose cubic meters
   (4.2 yd^3 × 1.15 = 4.83 loose cubic yards)

   Once the potential bucket load has been determined, check the static tipping load ratings on the specific machine to determine if bucket load is in fact a safe operating load. *(Safe operating load as defined by SAE for track loaders should not exceed 35% of static tipping load.)*

   Productivity in many applications is measured in tons. See Tables Section for material densities if conversion to tons is desired.
2. When material is in the bank state, as in excavation, productivity is measured in bank meters (cubic yards). Bucket load in Bm^3 (BCY) is estimated by applying one of the load factors from the Tables section to convert the excavated material in the bucket from Bm^3 (BCY) to Lm^3 (LCY) to allow for the digging and carrying characteristics of the material. The quantity of excavated material a bucket carries is then determined as follows:
   Rated Bucket Capacity × Load Factor × Bucket Fill Factor = Bucket Payload in Bm^3 (BCY)

   Example: a 953C with a 1.85 m^3 (2.4 yd^3) General Purpose bucket loading wet loam earth from bank:
   1.85 m^3 × 0.79 × 1.15 = 1.68 Bm^3
   (2.4 yd^3 × 0.79 × 1.15 = 2.18 BCY)

Estimating Production

Machine and job considerations include:
- Machine model and bucket size
- Material type, particle size, density and load factor (see Tables Section)
- Bucket fill factor
- Haul distance
- Underfoot conditions
- Altitude
- Dump target size, height, and type

Example:

Conditions —

Machine	953C
Bucket size	1.85 m³ (2.4 yd³)
Material	Moist Loam
Bucket fill factor	1.15
Haul length	30 m (100 ft)
Dump target	Pile
Travel in forward speed	

Cycle Time	**Minutes**
Load time	0.15
Maneuver time	0.20
Travel time (from curves)	0.40
Dump time	0.05
Total	0.80

Loads Per Hour —

$$\frac{60 \text{ min/hr}}{0.90 \text{ min/cycle}} = 75 \text{ cycles per hour @ 100\% efficiency}$$

Load Per Cycle —

1.85 m^3 × 1.15 BFF = 2.13 Lm^3 × 0.81 LF = 1.72 Bm^3

(2.4 yd^3 × 1.15 BFF = 2.76 LCY × 0.81 LF = 2.24 BCY)

Hourly Production —

1.72 Bm^3 × 75 cycles/h = 129 Bm^3/h

(2.24 BCY × 75 cycles/hr = 168 BCY/hr)

More accurate production estimates can be made by recording actual machine cycle times in the same or similar application. Then visually verify the approximate bucket fill factor.

Efficiency Considerations

Loader capacity should always be matched to peak production requirements of the job. Actual "on-the-job" loader productivity will be influenced by factors such as operator skill, personal delays, job layout and other delays. Experience and knowledge of local conditions will be the best indicators of actual job efficiency.

Operation	Working Hour	Efficiency Factor
Day	50 min/Hr	0.83

An Alternative Machine Selection Method

Another method of selecting the right Track Loader and bucket to meet production requirements is by use of the nomographs on the following pages. The method is quicker and easier than the proceding example because it does not require as many calculations, yet the accuracy is about the same within the normal limits of input data.

Be careful when entering and reading data from the nomographs because some scales increase from bottom to top, while others are the reverse. Do not be overly concerned with the precision as affected by pencil line width or reading to the hundredth of a m^3 (yd^3). Remember that bucket fill factor, material density, and cycle time are at best close estimates.

Example problem

A track loader must produce 200 Lm^3 (262 LCY) per hour. Estimated cycle time is 0.5 minutes, working 50 minutes per hour. Bucket fill factor is 110% and the material density is 1600 kg/Lm^3 (2700 lb/LCY).

Determine bucket size, machine model and hourly production in tons and yards.

Solution:

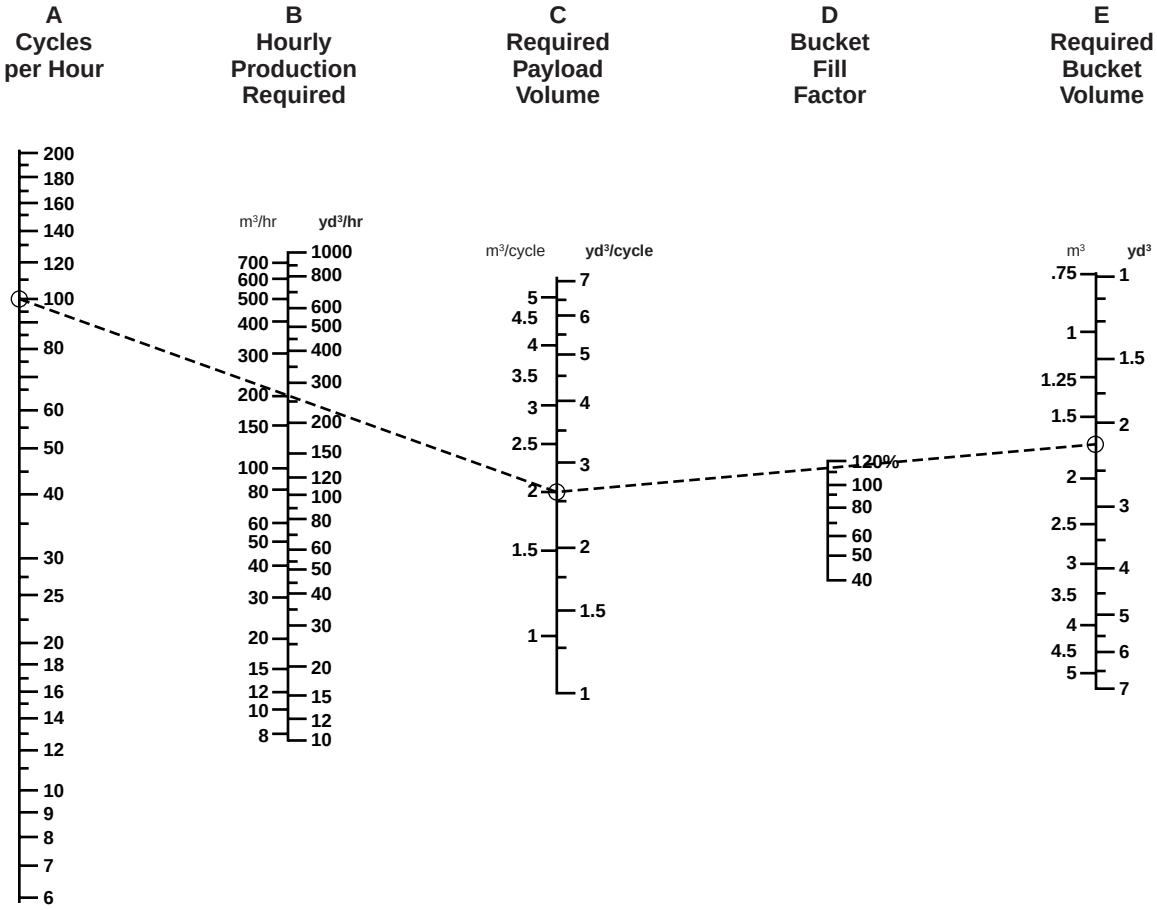
At full efficiency, it will cycle 120 times per hour. Since only an average 50 minutes are available, only 100 cycles will be completed per hour.

Starting on Scale A at 100 cycles per hour draw a straight line intersecting 200 m^3/hr (262 yd^3/hr) on Scale B and continuing the line on to Scale C giving 2.0 m^3 (2.62 yd^3) required payload.

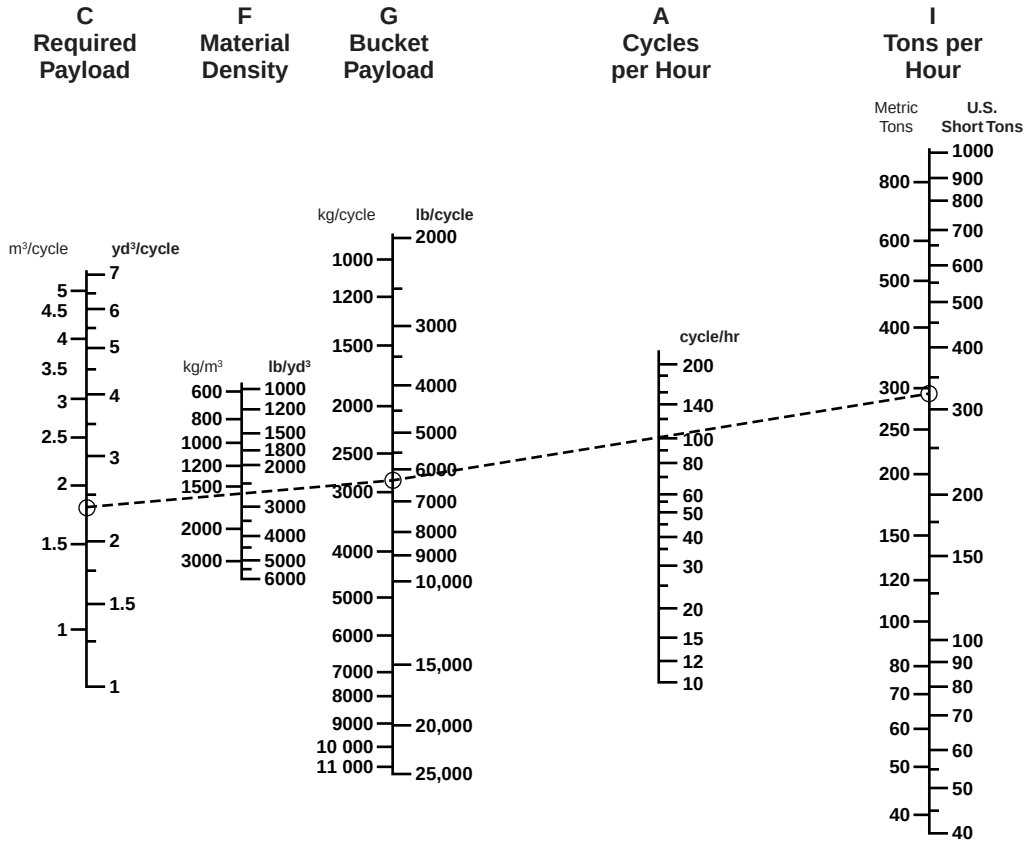
Follow steps 1 through 7 on the next two pages.

● ● ●

1) Enter Scale A cycles per hour (100) and B hourly production 200 m^3/hr (262 yd^3/hr).
2) Connect A and B and extend to C to find required payload 2.0 m^3 (2.62 yd^3).
3) Connect C to bucket fill factor on Scale D (110%) and extend to E to find required bucket size 1.8 m^3 (2.35 yd^3).
4) Transfer Scale A and C readings to nomograph on following page.



5) Connect C 1.8 m^3 (2.35 yd^3) to F 1600 kg/m^3 (2700 lb/yd^3) and extend to G to find payload weight 2880 kg (6345 lb).
6) Compare G bucket payload weight 2880 kg (6345 lb) with maximum operating capacities table in this section to see if the 1.85 m^3 (2.4 yd^3) bucket can handle the desired payload. Table indicates the 953C with a 1.85 m^3 (2.4 yd^3) bucket equipped with bolt-on cutting edge or teeth and segments has a greater operating capacity of 3343 kg (7370 lb), therefore stability is okay.
7) Extend Scale G reading 2880 kg (6345 lb) through Scale A (100) to Scale I to find tons per hour 288 metric ton/hr (317 U.S. ton/hr).



TRAVEL TIME CHARTS

Conditions:

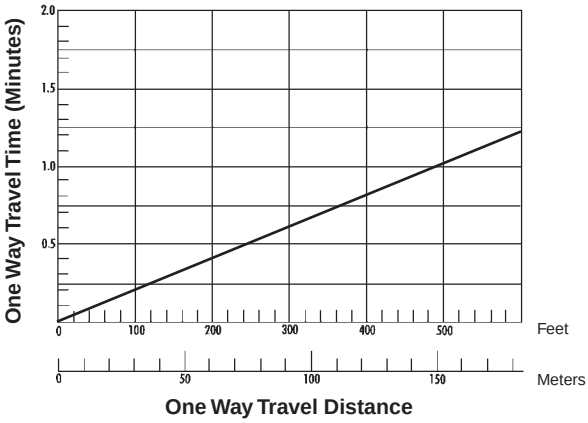
- No grades.
- Speeds loaded and empty essentially the same.
- Bucket position constant during travel.
- Travel encountered in maneuver time portion of cycle not included.
- Acceleration time accounted for in maneuver time.

Travel Time (in minutes) =

$$\textit{Metric} \quad - \frac{\text{number of meters traveled}}{\text{speed (in km/h)} \times 16.67}$$

$$\textit{English} \quad - \frac{\text{number of feet traveled}}{\text{speed (in mph)} \times 88}$$

933C



939C

Hydrostatic top speed both forward and reverse 9 km/h **(5.6 mph)**.

SHOE OPTIONS

① **Double Grouser Shoes**

② **Trapezoidal Center Hole Shoes**

③ **Single Grouser Shoes**

④ **Chopper Shoes**

- **Extreme service shoes** are available which have more hardened wear material for longer wear life and higher impact applications.
- **Wider shoes** are also available to reduce ground pressure in soft underfoot conditions.

Other shoe options are available. Consult a Caterpillar Dealer for more information.

INTEGRATED TOOLCARRIERS

CONTENTS

Features:

- **Integral quick coupler** for fast tool changes.
- **Wide range of tools** available to meet many jobs.
- **Increased lift height and reach** over conventional loaders.
- **Parallel lift** from ground level to maximum height.
- **High tilt force** throughout lift cycle provides exceptional load control.
- **Pressure compensating valves** provide precise hydraulic "feel" on the IT28G.
- **Transmission neutralizer lockout switch** for low speed maneuverability is standard. (IT14G-IT62G)
- **Positive carry position** for load stability and retention.
- **Standard third valve and optional fourth function** for multiple tool functions.
- **Work tool interchangeability.** IT14G thru IT28G share the same tools. IT38G and IT62G can share the same tools.
- **Excellent center visibility** to quick coupler and work tool.
- **Two position return** to work kickouts.
- **Several quick-coupler work tools** for IT38G and IT62G are available from the factory and ship with the machine. Contact your Caterpillar Dealer for details.

BUCKETS

General Purpose — for most material types with choice of cutting edges and teeth.

Loose Material — designed for snow, woodchips, hay, coal, etc. Add independently controlled top clamp for materials like hay, brush, silage or compost.

Multi-purpose — versatile ... loads, strips top-soil, bulldozes, clamps pipe, cleans up debris, plus many other tasks.

High dump or "roll-out" — for extended dump height of light materials.

Side dump — dump forward or to the left ... ideal in close quarters or to reduce turning time.

Grading — long, flat floor and straight edge for finish work in housing developments, concrete pours, landscaping and light dozing.

FORKS

Log or lumber forks — with optional clamps, single, double or full-width.

Wide frame forks — adjustable for control of long pipes, culverts, etc.

Stinger fork — with long single shaft to penetrate salvage autos or round hay bales.

Utility pallet forks — for a variety of tasks, with three different tine sizes.

Pulpwood — choice of single or double top clamp for positive control of material.

Sorting — designed for durability and efficiency in stacking operations.

BLADES

Angling dozer — choice of manual or hydraulic angling 25° left or right.

Straight blade — for spreading, leveling and other utility dozing.

One-way snow blade — economical snow clearing with minimal machine effort.

V-plow — excellent for breaking up large drifts or high speed clearing operations.

Material Handling arm — carries and places pipe, prefabricated building panels and handles bulky, nonpalletized material ... two telescopic sections extend for three position operation.

AND MORE ...

Rotary broom — for street cleanup, snow removal, jobsite clean-up, clearing runways ... angles left or right 30°.

Asphalt cutter — aids repair work on roads, pavements, water and sewer mains ... cuts clean to 125 mm (5").

Hooks — for attachment to dumpsters, bins, troughs, etc., to permit quick, easy, instant movement from place to place.

These products are available through your Caterpillar dealer.

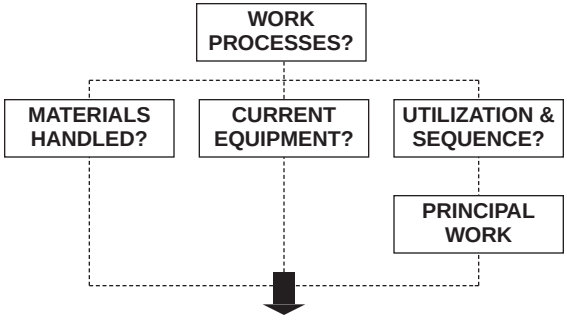
MACHINE/ATTACHMENT SELECTION

The Integrated Toolcarrier's versatility and the wide range of attachments makes the "single machine fleet" concept highly attractive to an increasing number of users.

A Job Analysis helps identify applications, work requirements, material handling parameters and the current working method. Thoroughly research each element in the following chart, the gathered information will help select the proper Integrated Toolcarrier System.

JOB ANALYSIS METHOD



- **APPROPRIATE INTEGRATED TOOLCARRIER MODEL SIZE**
- **NECESSARY ATTACHMENTS**

Work Processes:

The first step in the job analysis is to identify all work processes from start to finish. Key questions outlined below will begin to indicate the required attachments and potential Integrated Toolcarrier applications.

- What kinds of work are performed: (e.g., dozing, loading, stacking, digging, sweeping, handling special materials, etc.)
  - ... in site preparation?
  - ... below ground level?
  - ... at ground level?
  - ... above ground level?
  - ... in landscaping?
  - ... in maintenance equipment yard?
  - etc.
- What work is done manually that could be done with an Integrated Toolcarrier?
- What are the work conditions?:
  - ... underfoot?
  - ... grades?
  - ... tight quarters?
  - ... time restraints?
  - ... climate?
  - etc.

Materials Handled:

Examining the materials handled will assist in determining necessary attachments. Sizes and weights of material(s) handled will indicate the appropriate Integrated Toolcarrier model by defining lift and reach requirements. Concentrate on the material flow at the job site — the point of origin as well as the final destination for the various materials will undoubtedly have material handling requirements.

- What kinds of materials are handled (e.g. snow, earth, bricks, chemicals, pipe, logs, etc.)
- What form are the materials handled in: bulk? palletized?
- How much does each weigh?
- What are the dimensions of each?
- What are the... movement parameters:
  - ... dozed what distance?
  - ... load and carried what distance?
  - ... lifted how high?
  - ... placed below ground level?
  - ... placed what distance from machine?

Current Equipment:

If determining material weight is not possible, much information can be determined from looking at the current equipment fleet. This will suggest required performance capabilities such as lifting capacity.

- Machines currently doing the work (e.g. wheel loaders, lift trucks, sweepers, light capacity cranes, snow plows, etc.)?
- What special (maximum) capabilities does each machine have (production, lift height, load capacity, width/height dimensions, reach, turning radius, travel speed, etc.)?
- To what extent are each machine's maximum capabilities used?
- What are owning/operating costs of each?

Utilization & Sequence:

Utilization implies how often the current machines are used and what will be the utilization factors for the Integrated Toolcarrier with each individual attachment. Sequence implies what order these tasks are accomplished in and if two or more machines operate at the same time. This portion of the job analysis should assist in comparing economies of various systems. Other important considerations may be the number of operators needed, storage space, reduced maintenance requirements, etc.

- How often (what percent) is each machine used?
- How often and when does it sit idle?
- How often and when do two or more machines work at the same time?
- Can the operation be changed to permit single machine operation?

Principal Work:

Utilization and sequence will indicate the principal work the Integrated Toolcarrier will do, further assisting in attachment and model sizing and selection. The basic machine/tool package should be able to handle the toughest, most frequently performed jobs for the primary application. Secondary tools can have a little more "give and take" in their performance capabilities than the primary tool.

- What work can be accomplished by an Integrated Toolcarrier?
- What work will take up the majority of Integrated Toolcarrier time?
- What work will use the maximum static tipping capabilities of the Integrated Toolcarrier?
- What high cost (owning and operating) and/or low utilization machines can be replaced by an Integrated Toolcarrier?

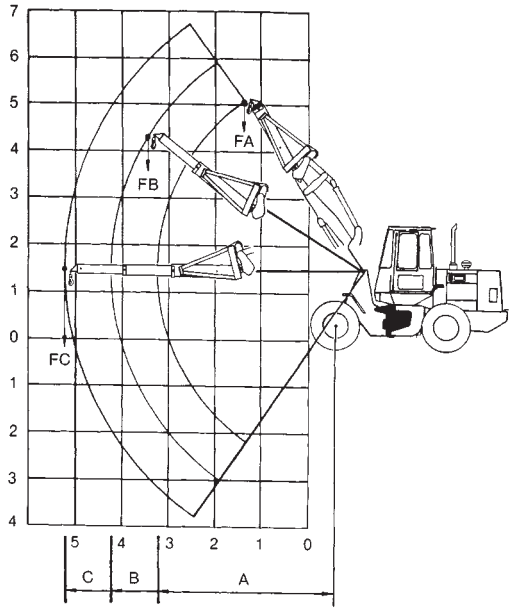
Additional Tips for Tool Sizing and Selection

Tool selection will principally concern hydraulic power requirements and static tipping load considerations. The standard tools offered by Caterpillar can be used on any Integrated Toolcarrier machine with little difficulty. However, tools such as the hydraulic broom, claws, blades and asphalt cutter will require additional consideration before proposing a system to the customer.

Rating Plates

The Caterpillar tools have rating plates showing rated or recommended load limits for each machine in standard configuration. These rated loads are determined by structural limitations on the tool and/or hydraulic and stability criteria established for each machine. The IT14G thru IT28G share common attachment points and can share attachments. The IT38G and IT62G can share the same attachments. This ability to interchange tools necessitates the need for rating plates.

Shown below are examples of the rating plates that will be found on each Caterpillar tool. Beginning with the IT14G, the rating plate on each tool will refer the user to the Operation and Maintenance Manual for the rated operating load for that tool on a specific machine model.



Material Handling Arm Part No. 9V1795

Table indicates rated load at standard vehicle configuration. See operator's manual to determine rated load for vehicle configuration being used.

Model	Load Radius						Rated Load					
	A		FA		B		FB		C		FC

*Specifications shown are for high-speed version IT14G and include lubricants, full fuel tank, ROPS cab, 80 kg **(176 lb)** operator, standard 250 kg **(550 lb)** counterweight and 17.5-R25 (L-2 equivalent) tires.

Specifications shown include lubricants, full fuel tank, ROPS cab, 80 kg **(176 lb) operator and 17.5 x 25, 12 PR (L-2) tires.

***Specifications shown include optional counterweight, standard lubricants, full fuel tank, ROPS cab, 80 kg **(176 lb)** operator and 20.5-25, 12 PR (L-2) tires.

†Std. machine with sound suppressed cab, ROPS, 20.5R25, XTLA (L-2) tires, full fuel tank, coolant, lubricants and operator.

††Std. machine with 23.5R25, XHA (L-3) tires, air conditioning, crank case and power train guards, full fuel tank, coolant, lubricants and operator.

The bucket rating plate can be used to illustrate the attachment sizing and selection process. The charts explain each machine's maximum payload. The maximum material density would be determined by dividing the payload by the bucket capacity. If the actual material density exceeds the recommended material density, the process should be repeated to select the properly sized bucket.

A similar procedure would be used with the forks and material handling arm to determine maximum recommended lifting capacity and/or required IT model size.

Pallet Fork

The pallet fork will fulfill many material handling needs. A modified Class 3 fork carriage provides visibility to the tines for precision pallet work. This carriage with non-standard spacing accepts many Class 3 lift truck attachments.

Pallet fork rated operating loads are based on the following:

SAE J1197 FEB91: 50% of the full turn static tipping load or the hydraulic/structural limitations.

CEN 474-3 (European standard): 60% of the full static tipping load on rough terrain or the hydraulic/structural limitations. 80% of the full turn static tipping load on firm, level ground or the structural/hydraulic limitation. Other local, regional or international guidelines may also apply.

If operation is on rough ground these criteria may need modification. In this instance, the size and rating of existing equipment should be considered.

Sizing for pallet work generally consists of answering the following questions.

1. What are the average loaded pallet dimensions?
2. Lift Capacity — what capacity is required to lift and move the average pallet load? The maximum pallet load?
3. Lift Height — can the machine reach the top level of the standard pallet stack? What are the maximum reach, lift and height requirements?
4. Maneuverability — can the machine work around the current aisle configuration? In the stacking aisles? Main aisles? Intersecting aisles? Are 90° turns required in any aisle for material placement?
5. Length — what tine length is required to fit the commonly used pallets? (1219 mm [4'0"] tines are standard length for most palletized material.)
6. Any machine height restrictions?
7. Any special fork configurations required?

Lift capacity, lift height, aisle configuration and tine length are the most important considerations in recommending a pallet handling machine.

Example problem:

The following example applies the job analysis method to a work situation.

Sewer & Water Contractor

Sets water lines (152 mm-610 mm [6 in-24 in] iron pipe), sanitary sewer lines (152 mm-457 mm [6 in-18 in] PVC) and storm sewer lines (610 mm-1067 mm [24 in-42 in] concrete pipe) primarily in urban areas ... often-times across or down existing streets.

Materials

Loam/Clay: 1600 kg/m^3 (2700 lb/yd^3) loose density

Bedding (Gravel): 1900 kg/m^3 (3200 lb/yd^3) loose density

Water Pipe: 610 mm (24 in) push-on joint ductile iron, 6.1 m (20 ft) sections, 1309 kg (2885 lb) 215 kg/m (144.3 lb/ft) × 6.1 m (20 ft) See trenching pages in the Excavator backhoe section.

Storm Sewer: 1067 mm (42 in), Wall B, concrete pipe, 1.5 m (5 ft) sections, 1556 kg (3430 lb) 1021 kg/m (686 lb/ft × 5 ft) See trenching pages in the Excavator backhoe section.

Manhole Boxes: 1361 kg (3000 lb)

WHAT INTEGRATED TOOLCARRIER MODEL SHOULD BE RECOMMENDED?

WHICH ATTACHMENTS?

Work Processes	Integrated Toolcarrier Attachment Possibilities
Bundled PVC and individual concrete/iron pipe-loaded/unloaded (yardsite) and strung along trench	Forks/Material Handling Arm
Unload, handle, set manhole boxes	Material Handling Arm
Excess excavated material truck loaded	Bucket
Bedding material handled/placed	Bucket
Trench backfilled	Bucket/Blade
Trench compaction	Compactor Wheel
Rough and finish grading	Bucket/Blade
Street cleanup	Bucket/Broom
Pavement removal	Rebar Snips/Asphalt Cutter

Current Equipment

Utilization

Cat 225 . . . . . .90%

Champ CB607 lift truck, 3175 kg (7000 lb) capacity 15%

Deere 444 with 1.1 m^3 (1.5 yd^3) G.P. bucket 60%

Rosco D-50 sweeper . . . . . .one half hour/day

Rammax 1361 kg (3000 lb) self-propelled trench compactor 25%

Machine sizing

1350 mm (53 in) Forks

Operating Load at Full Turn*

Model	kg	lb
IT14G	1735	**3817**
924G	2361	**5194**
IT28G	2931	**6463**

Water pipes: 1309 kg (2885 lb)
- IT14G ... 1 pipe — no problem
- 924G … 1 pipe — no problem
- IT28G ... 1 pipe — no problem

Storm sewer pipes: 1556 kg (3430 lb)
- IT14G ... 1 pipe — no problem
- 924G … 1 pipe — no problem
- IT28G ... 1 pipe — no problem

*Note that the most conservative operating load (SAE J1197 FEB91) is used here. The rated operating load for some competitive machines with pallet forks will be based upon European standard CEN 474-3, **assuming operation on firm and level ground** (i.e. using 80% of full turn static tipping load).

Material Handling Arm (MHA)

The rated load for the MHA is 50% of the full turn static tipping load in each position or hydraulic or structural limitations. Manually extendable telescopic sections enable maximum lifting capacity at the full retracted position, and maximum lift height and reach in the fully extended position.

Operating Load at Full Turn

Model	Retracted	Mid	Extended

Storm sewer pipes: 1556 kg (3430 lb)	IT14G ... no 924G ... yes in retracted IT28G ... yes in retracted and mid
Manhole boxes: 1361 kg (3000 lb)	IT14G ... no 924G ... yes in retracted and mid IT28G ... yes in retracted, mid and extended

Buckets

All general purpose buckets are interchangeable on 924G-IT28G due to common attachment points on the quick couplers. Bucket selection will depend on the material density in your application. Offering multiple sized buckets allows the user the flexibility to closely match material density and bucket size with machine capability. Equipping a machine with too large a bucket will result in unacceptable stability — too small a bucket may provide inadequate tire coverage.

Bucket 1900 kg/m³ (3200 lb/yd³) ... 100% fill factor

Model	Bucket	Payload	50% Full Turn Static Tipping

	2.0 m³	3800 kg	3668 kg
	2.6 yd³	**8360 lb**	**8087 lb**
IT38G	2.3 m³	3856 kg	3850 kg
	3.0 yd³	**8500 lb**	**8488 lb**

NOTE: Metric numbers are a product of conversion.
*924G and IT28G equipped with 17.5 × 25 tires.

Machine/Attachment Recommendation

IT28G — The greater static tipping load capabilities allow it to do a greater portion of the contractor's total work processes. With the following attachments, the IT28G could replace part or all of the specialty units, such as the wheel loader, rough terrain lift truck, street sweeper, and/or the trench compactor.
1.8 m³ (2.3 yd³), or 2.0 m³ (2.6 yd³) General Purpose Bucket
1350 mm (53 in) forks (handles all pipes)
Material Handling Arm — (handles pipe sizes under 1067 mm (42 in) concrete and manhole boxes ... 225 would have to set 1219 mm (48 in) and larger concrete pipe
Broom

Optional Attachments to Consider:

24-LH compactor wheel
Rebar snips
Asphalt cutter

Notes —

TELESCOPIC HANDLERS

Over Bucket @ carry	3.94 m	**12'11"**
Tires	15.5-25	
Service Refill Cap:		
Fuel Tank @ 90% fill	120 L	**32 U.S. gal**
Hydraulic Tank	150 L	**40 U.S. gal**

Features:

- **Tough, reliable machine components** — Cat 3054 turbocharged engines, powershift transmission, enclosed oil immersed brakes, differential lock on front axle and mechanical driveline. Variable displacement axial piston pump. Proven components and well protected from the perils of the jobsite.
- **High visibility factors** — include low boom pivot point, side mounted power module and close fitting fenders. Carefully profiled engine hood allows front wheel visibility. Low profile stabilizer option on 3-section machines provides excellent forward visibility.
- **Excellent Operator Comfort** — with large spacious operator station. Open cab or deluxe closed cab with large glazed glass area. Single lever pilot operated boom control. Powershift transmission with 4 forward speeds, 3 reverse and transmission disconnect. Power assisted brakes and steering. Easy engine access for daily maintenance.
- **Superior Performance** — with low center of gravity, maximized wheel base. Fast, responsive hydraulic system with variable displacement axial piston pump. Front and rear overhang is minimized. Four wheel drive and steer with three steering modes, 2-wheel steer, circle steer and crab steer.

Attachment Selection — Non-U.S. Versions

- Carriages
- Forks

All carriages are bar type with load backrest to support bulky loads.
Widespread carriages provide added stability for lifting larger loads.
Standard and widespread carriages are also available in rotating mode.

PAVING PRODUCTS

CONTENTS

Cold Planer Features:

- **Cat Diesel Engines** with large piston displacement and individual adjustment-free fuel pumps and valves.
- **Up-cutting mandrels** provide cutting efficiency and improved bit life.
- **Grade and slope system** produces ± 3 mm (0.125 in) tolerance.
- **Non-contact sensors** speed set-up on PM-565B and PM-465.
- **Short turning radii** for productivity and jobsite flexibility.
- **Front-discharge conveyor on PM-565B and PM-465** facilitates haul unit movement in congested urban applications.
- **Optimum weight-to-horsepower balance** for delivering maximum available horsepower to the cutter.
- **Computerized Monitoring System (CMS)** provides three warning levels for abnormal operating conditions on PM-565B and PM-465.
- **Load control system** on PM-565B and PM-465 keeps machine operating at peak efficiency.
- **Variable width cutter** available for PM-565B and PM-465.
- **Water spray system** for dust control and bit cooling.

NOTE: Above figures are based on a one-inch depth of cut. For greater depths of cut, multiply the production rate by cutting depth. Based on asphalt density of 115 lb/yd^2, one inch thick.

MACHINE SELECTION

Prime considerations in selecting the proper cold planer model are:
— specifics of work to be done
— type of projects generally done by the contractor
  ● City/Urban or Highway/Airport
— desired production capacities

Cold Planer Characteristics (Highway/Airport)

Highway/Airport work requires high-volume cold planers. The PM-565B and other high horsepower half-lane cold planers are being used more on Highway/Airport projects. Users like to have one machine that can work successfully on high production jobs then switch to city/urban applications. The PM-565B has proven to be a true cross-over cold planer.

Cold Planer Characteristics (City/Urban)

The PM-465 is a four track, front discharge cold planer designed primarily for the Urban/City environment. The PM-465, with its tight turning radius and easy set up, makes it suitable for many applications. The PM-465 has the productive capacity to perform effectively on highway applications as well. Machine dimensions and weight allow transport on one truck, often no special weight permits are required.

The PM-565B is a four-track, front discharge model. Front discharge cold planers make traffic control easier in congested quarters. The trucks travel forward in the same direction as the cold planer. The trucks move in and out of traffic faster increasing production.

COLD PLANING FUNDAMENTALS

Definition

Cold planing is automatically controlled cold milling to restore the pavement surface to a specified grade and slope; remove bumps, ruts, and other imperfections; and leave a textured surface which can be opened immediately to traffic or overlayed with new pavement materials.

Production and Tooth Wear

Because pavement materials vary, so do production and tooth wear. While predicting the exact production rate and tooth wear on a particular job is difficult, general guidelines are available.

Production depends on the milling rate (the speed at which the cold planer moves forward). The machine's forward speed is determined, primarily, by aggregate type, asphalt bond strength and depth of cut. When milling asphalt pavement, the cold planer's teeth essentially are breaking the bond between asphalt-coated aggregate, not actually fracturing the aggregate itself. A pavement made with a mix containing a high percentage of fine aggregate and a high asphalt content is more difficult to mill than a pavement with a high percentage of coarse aggregate.

A dense or fine mix usually requires more power at the cutting drum, limiting the cold planer's forward speed. Decreased speed lowers production, and the tough bond between the small aggregate particles causes increased cutting-tooth wear. Lower production and higher tooth wear result in increased unit costs.

Cutting depth affects power demand at the drum and helps determine the cold planer's forward speed. However, production increases, to a point, as the depth of cut increases. For example, changing from a 25 mm (1 in) cut to a 51 mm (2 in) cut slows the machine only slightly but doubles the amount of material produced.

As the cut increases beyond the machine's peak-production depth, the reduced forward speed begins to offset the production gains of the deeper cut. For example, production at a 152 mm (6 in) cutting depth and slow speed may be no greater than cutting at a 76 mm (3 in) depth and a much faster speed.

As long as the cold planer maintains a productive forward speed, deeper cuts will yield greater production and tend to lower tooth cost. Tooth wear does not increase in direct proportion to production when the machine is working in an efficient range.

Tooth wear at various depths for a given material is affected by how long the tooth remains in the cut. Because the teeth are mounted on a circular drum, each tooth cuts through the pavement in an arc. The tooth arc at a 102 mm (4 in) cutting depth, however, is not four times longer than at a 25 mm (1 in) cutting depth, even though production may be four times greater. The cutting arc at 102 mm (4 in) is approximately twice as long as that at 25 mm (1 in).

The peak cutting depth for a particular cold planer on a specific job is best determined by examining production, and subsequent costs, of a single deep cut versus multiple passes at a shallow depth.

APPLICATIONS

Although new applications for cold planers are being discovered, most work can be classified in seven general categories:

Leveling and Bonding

This application removes a layer of pavement to eliminate potholes, ruts, bumps and other surface imperfections. The cold planer leaves a level, textured surface ideal for bonding to a new, thin overlay of asphalt or concrete. The surface has an interlocking texture with double the bonding area of a conventional smooth pavement. The textured surface and overlay form a monolithic bond, eliminating the shear plane that causes pavement layers to move and separate. Thinner overlays can be used, making the technique more economical than traditional overlay methods.

Surface Refinishing

Rough pavement can also be cold planed to specified grade and slope, providing a new riding surface without adding new paving materials. This application is particularly useful when base and sub-base are in good shape, or when several layers have been added to the roadway over the years. Roads can be cold planed during cold, wet months and reopened immediately. New overlays can be added whenever weather permits. This lengthens the practical working season for many contractors. The cold planer can also be used to correct expansion joint faults and pavement cracks.

Surface Repair

This category generally requires deeper cutting than leveling. It consists of removing isolated distressed pavement sections down to subbase, if necessary, prior to adding new overlay materials. Since the cutter mandrel on Caterpillar cold planers cuts forward and upward, there's no damaging impact to the underlying base.

Pavement Removal

Pavement buildup is a problem that plagues most older streets, roads and highways. As overlays are added, curbs and drains are buried — creating drainage problems. Overhead clearances are dangerously reduced … and additional weight is added to overpasses and bridges. Cold planing is an economical method of curing all these problems.

Surface Texturing

Serious accidents increase when pavement becomes slick from wear. The textured surface produced by cold planing is highly skid-resistant and has dramatically reduced hydroplaning characteristics.

Pavement Mining

Cold milling has made it practical to actually "mine" deteriorated pavement materials from existing roads and streets. The cold planer produces an ideally-sized asphalt or concrete material which can be recycled in a variety of ways. Depending on type, age and condition of pavement, the largest cold planer can reclaim up to 900 tons of material per hour.

COLD PLANER USE BY PROJECT TYPE

Applications	Highway/Airport	City/Urban
Planing (Milling)	• To establish grade and slope. • Remove excess pavement.	• To establish proper grade and slope. • To establish new grade and slope.
Partial Removal	• For use with hot mix recycle. • Remove pavement irregularities. • Texture for skid resistance.	• To correct drainage and curb reveal. • To lower elevation at overpass. • For use with hot recycle. • Eliminate leveling course.
Full Depth Removal	• Total rebuild. RAP used for base or hot recycle. • Cold recycle. This requires additional surface treatment.	• Total rebuild. RAP used for base or hot recycle. • Cold recycle. Requires additional surface treatment.
Texturing	• For skid resistance and improved bond when overlay is applied.	• For skid resistance and improved bond when overlay is applied.
Leveling		• At intersections to remove bumps, shoving and improve drainage.
Special	• Joint and crack repair. • Cut rumble grooves on shoulders of bridge approaches.	• Intersection defect repair. • Pothole repair. • Railroad crossing repair. • Tight radius profiling around manhole covers, etc. • Pavement adjustments (transitions from existing pavements to new overlays).

RR-250B:

The RR-250B is a single rotor full depth reclaiming machine. It uses a cutting mandrel to pulverize and mix asphaltic pavement and base materials. The machine is utilized to mechanically stabilize deteriorated asphalt structures and complete reclamation with the addition of asphaltic emulsions or other binding agents. The RR-250B can be equipped with attachments that accurately inject liquid additives directly into the mixing hood. Optional rotors can be installed to convert the RR-250B into a soil stabilizer. The internally mounted breaker bar aids in material sizing.

SS-250B:

The SS-250B is a single rotor soil stabilization machine. The machine cuts, mixes and pulverizes native in-place soils or select materials, with or without additives. It modifies and stabilizes the soil obtaining a strong base.

Both the RR & SS-250B feature automatic depth control, engine load sensing, and rear steering.

RM-350B:

The RM-350B is a heavy-duty reclaimer/mixer, that can perform either full depth reclamation, or soil stabilization. Rotor options allow the RM-350B to perform the pulverization of asphalt pavement, or the mixing of stabilizing agents with soils to produce a strong base material.

The RM-350B features microprocessor control of major machine systems, including propel speed, rotor depth, and steering modes.

RR-250B/SS-250B Features:

- **Maximum Production** … rotor driven by Cat turbocharged Diesel Engine through mechanical drive system.
- **Highly Efficien**t … load-sensing propel system helps prevent overloading while allowing continuous work near rated horsepower.
- **Extremely Versatile** … interchangeable rotors provide both reclamation and stabilization capabilities.
- **Consistent Blending** … automatic depth control, mid-mounted mixing chamber and multi-speed rotor drive combine for optimum blending and increased production.

RM-350B Features:

- **Maximum Production** … mechanical rotor drive, with deep cutting and mixing capability, via Cat turbocharged Diesel Engine and Cat three-speed transmission.
- **Efficient Operation** … Cat Electronic Control Module provides microprocessor control of major machine systems.
- **Highly Maneuverable** … four steering modes with automatic rear wheel alignment simplify work in congested areas.
- **Versatility** … choice of three rotors for full depth reclamation or soil stabilization.
- **Reliability** … field proven Cat components maximize machine availability.

OPTIONAL EQUIPMENT — RR-250B/SS-250B

- Roll Over Protective Structure (ROPS).
- Foot per minute indicator (available in metric).
- Working light package.
- Cab with heater, defroster and air conditioner.
- Liquid additive system (emulsion or water) (English or Metric).
- Water spray system with in-line flow meter.
- Rear wheel power.
- Sound suppression package.
- Torque limiter.
- Mirror package.
- Various rotor options.

OPTIONAL EQUIPMENT — RM-350B

- Roll Over Protective Structure (ROPS).
- Working light package.
- Roading light package.
- Deluxe cab.
- Liquid additive system (emulsion or water).
- Water spray system.
- Sound suppression package.
- Rear wheel power.
- Mirror package.
- Various rotor options.

Rotor Options for SS-250B

Rotor	Maximum Depth of Work		No. of Bits/Tools	Direction of Cut
Quick Change Tool	381 mm	**15"**	58	Up
Deep Mix Quick Change	457 mm	**18"**	58	Down
Combination	381 mm	**15"**	108	Up

Rotor Options for RR-250B

Rotor	Maximum Depth of Work		No. of Bits/Tools	Direction of Cut
Cone Tool Milldrum	330 mm	**13"**	188	Up
Breakaway Holder Rotor	330 mm	**13"**	188	Up
Quick Change	381 mm	**15"**	58	Up
Combination	381 mm	**15"**	108	Up

Rotor Options for RM-350B

Rotor	Maximum Depth of Work		No. of Bits/Tools	Direction of Cut
Reclamation	381 mm	**15"**	190	Up
Quick Change	508 mm	**20"**	58	Up
Combination	457 mm	**18"**	108	Up

Other rotors available by custom order.

PRODUCTION ESTIMATING

The maximum cutting depth is 381 mm (15 in) for the RR-250B and 457 mm (18 in) for the RM-350B. The SS-250B can mix up to 457 mm (18 in). In addition, the cutting width of their rotors is 8 feet. The following formulas allow you to determine the production in square yards (yd^2)/minute or cubic yards (yd^3)/minute.

Production in square yards (yd^2) per minute

$$yd^2/min = \frac{\text{FPM of travel speed}}{1.125}$$

$$\frac{9\ ft^2/yd^2}{8\ ft\ \text{Cutting width}} = 1.125$$ (This is a constant value for an eight foot wide rotor)

Gallons of additive (for units with pump and metering additive system)

$$\frac{GPM}{yd^2/min} = gal/yd^2$$

Or, if required additive amounts are known, you can determine necessary travel speed as shown:

$$\frac{GPM}{gal/yd^2} = yd^2/min;\ yd^2/min \times 1.125 = ft/min$$

Production in Cubic Yards (yd^3) per minute

$$\frac{\text{FPM of travel speed}}{1.125} \times \frac{\text{Cutting or mixing depth in inches}}{36} = \frac{yd^3}{min}$$

Production in Tons per Minute

$$yd^3/min \times \frac{\text{Wt. of Material per yd in lbs}}{2000\ lb/ton} = tons/min$$

Abbreviations

FPM = Feet Per Minute
GPM = Gallons Per Minute

STABILIZATION/RECLAMATION PRODUCTION

The following charts list production in square meters per minute, square yards per minute, cubic meters per minute, and cubic yards per minute. The information is based on various travel speeds and cutting depths for the Caterpillar RM-350B, RR-250B and SS-250B equipped with a 2438 mm **(8 ft)** cutting rotor.

Features:

- **Patented variable speed hydraulic augers on AP-200B** extend with wings to ensure proper material distribution.
- **Self-cleaning all-steel tracks on AP-200B** assure long life with virtually no maintenance required.
- **Variable width Extend-A-Mat B screeds or Pavemaster B fixed screeds** available for AP-650B, AP-800C, AP-900B, AP-1000B, AP-1050B and AP-1055B.
- **Single sliding operator's station** can be positioned on either side of paver for excellent visibility.
- **Hydrostatic pumps** provide infinitely variable speed ranges.
- **Direct hydrostatic drives** eliminate gear boxes, differentials, final drive chains etc.
- **Self-dumping hydraulic hoppers** are heavy-duty and high capacity.
- **Soldered and molded** electrical connections.
- **Feeder system** designed to eliminate power segregation and manual hand work.
- **Self diagnostics** on propel and feeder systems.

***Counter-rotates within own track length.

Features:

- **New variable width Extend-A-Mat B Screeds** or Pavemaster B fixed screeds available for all Barber-Greene paver models.
- **Designed With the Crew In Mind** … for simplified, more efficient operation and unmatched access to operational controls and service areas.
- **Simplified Drive System** … variable pump/motor propel system that covers all machine speed ranges required to increase paver productivity.
- **Material Handling System** … fully hydrostatic drive provides smooth efficient operation with the capability to handle today's varied paving requirements.
- **Complete Range of Models** … both rubber tired and crawler mounted pavers to meet any paving requirement.
- **Dependable Operation** … job proven Barber-Greene design and engineering for mile after mile performance.
- **Service Accessibility** … swing-out panels and decks provide generous access.
- **Complete Customer Support** … unmatched in the paving industry.

ASPHALT PAVING CHARTS

These charts will assist you when trying to match plant output with paving speeds. Keep in mind when using these charts, it will be at 100% efficiency. If you know efficiency, multiply T.P. hour × efficiency. (Example: 75% efficiency at 300 T.P.H. – 300 × 0.75 = 225 T.P.H.)

Production in tons/hr with 1" compacted mat

Speed	Paving Widths						
fpm	6'0"	7'0"	8'0"	9'0"	10'0"	11'0"	12'0"
10	22	26	29	33	37	40	44
20	44	51	58	66	73	80	88
30	66	77	87	99	110	120	131

50	110	129	145	164	183	201	219

Production in tons/hr with 2" compacted mat

Speed	Paving Widths						
fpm	6'0"	7'0"	8'0"	9'0"	10'0"	11'0"	12'0"
10	44	52	58	66	74	80	88
20	88	176	116	132	146	160	176
30	132	154	174	198	220	240	262
40	176	204	232	262	292	322	350
50	220	258	290	328	366	402	438

Production in tons/hr with 3" compacted mat

Speed	Paving Widths						
fpm	6'0"	7'0"	8'0"	9'0"	10'0"	11'0"	12'0"
10	66	78	87	99	111	120	132
20	132	153	174	198	219	240	284
30	198	231	261	297	330	360	393
40	264	306	348	393	438	483	525
50	330	387	435	492	549	603	657

Production in tons/hr with 4" compacted mat

Speed	Paving Widths						
fpm	6'0"	7'0"	8'0"	9'0"	10'0"	11'0"	12'0"
10	88	104	116	132	148	160	176
20	176	204	232	264	292	320	352
30	264	308	348	396	440	480	524
40	352	408	464	524	584	644	700
50	440	516	580	656	732	804	876

Features:

- **Superior maneuverability.** The BG-730 is equipped with four wheel steering and three steering modes which provide unmatched maneuverability on the job … turn radius under 4267 mm (14 ft).
- **Unmatched traction**. Four wheel drive on the BG-730, with differential locks on the drive axles combined with engine horsepower and weight distribution make the toughest widening jobs easy.
- **High capacity conveyors.** High capacity 762 mm (30 in). wide belt conveyors for handling large projects.
- **Quick shift conveyor.** The BG-730 conveyor is equipped with a dual drive system allowing rapid change of direction. Conveyor shifts hydraulically from side to side.
- **Power dump front hopper lip.** Front lip on hopper hydraulically lifts to clean out material after truck dumps, reducing hand work.
- **Sliding operator's console.** Operator's console slides from side to side providing rapid change of station location.

MODEL	BG-730	
Flywheel Power	114 kW	**153 hp**
Rated Engine RPM	**2200**	
No. Cylinders	**6**	
Displacement	6 L	**365 in³**
Engine Model	**3116T**	
Operating Weight	14 062 kg	**31,000 lb**
Speeds: Paving	0-98 m/min	**0-320 fpm**
Travel	0-24.1 km/h	**0-15 mph**
Maximum theoretical capacity	3658 (t)/hr	**3600 TPH**
Tires	**15.00 × 22.5**	
Dimensions:		
Length with pushroller	7820 mm	**25'8"**
Operating height	2921 mm	**9'7"**
Shipping height	2578 mm	**8'5.5"**
Shipping width	3048 mm	**10'0"**
Turning Radius	3962 mm	**13'0"**
Wheelbase	4572 mm	**15'0"**
Hopper Capacity	10 m³	**80 ft³**
Truck entry width	2845 mm	**9'4"**
Laydown widths	to 3048 mm	**to 10'**
Service Refill Capacities:		
Cooling system	28.4 L	**7.7 U.S. gal**
Fuel tank	151.4 L	**40 U.S. gal**
Hydraulic oil tank	151.4 L	**40 U.S. gal**

Features:

- **Attaches easily to most pavers.**
- **Allows for continuous paving operations.**
- **High capacity conveyor** with 1905 mm (75") discharge height provides full power hopper loading.
- **Foot shaft combining augers** provide a wide throat for pick up off-center and extra wide windrows.
- **Wide throat** allows machine to pickup windrows from bottom dump trailers, end dump trailers or trucks.
- **Height adjustable scraper** mounted behind combining augers maintains a clean path for paver.
- **Three point suspension** allows machine to closely follow road contours.

MODEL	BG-650	
Flywheel Power	80 kW	**107 hp**
Engine RPM		**2100**
Operating Weight	7973 kg	**17,600 lb**
Engine		**3054DIT**
Displacement	4 L	**243 in^3**
General Dimensions:		
Operating height	2946 mm	**9'8"**
Shipping height	2946 mm	**9'8"**
Length	4267 mm	**14'0"**
Conveyor:		
Maximum theoretical capacity	1829 (t)/hr	**1800 TPH**
Discharge height	1905 mm	**6'2"**
Width	1524 mm	**5'0"**
Lift	178 mm	**7"**
Tires:		
Front (2)	178 mm × 559 mm	**7" × 22" Solid Rubber**
Rear (2)	8.25 × 15	**8.25 × 15**
Service Refill Capacities:		
Fuel	151.4 L	**40 U.S. gal**

General Compactor Features:

- **Routine maintenance** simplified by grouped service points and easy access to service areas.
- **Operator stations** designed for maximum comfort, easy control, and optimal visibility.
- **Direct hydrostatic drive to front (drums or wheels) and rear (drums or wheels)** provides dependable, responsive, propulsion effort and maximum gradeability. (Does not include pneumatic tire compactors.)

Vibratory Compactor Features:

Single Drum

- **Hydraulic flow divider valve (CS/CP-323C) or dual pump system** delivers positive tractive effort to both drum and rear wheels, regardless of underfooting. This increases the machine's ability to maneuver in a wide variety of soil types and conditions and improves gross gradeability.
- **NoSPIN high traction differential** is standard on all units (except CS/CP-533C) for best traction of rear tires.
- **Optional heavy-duty front-mounted blade** with reversible cutting edge is available to allow backfilling and leveling during compaction.
- **ROPS (Roll Over Protective Structure)** standard on all units. Enclosed cabs with EROPS rating available as an option (except for CS/CP-323C).
- **Adjustable jaw-type cleaner bar** keeps drums clean between pads during forward and reverse movement.

Double Drum and Combi

- **Vibration automatically ceases before machine comes to a stop (CB-434D and larger)** to help produce a smooth, flawless mat surface.
- **Close side clearances** allow compactors to work close to curbs, walls and other obstructions.
- **Large, rust-proof water tanks and pressure spray system** provide hours of reliable operation between fill-ups.
- **Emulsion system** available for combi compactor rear tires to prevent materials sticking to tires.
- **ROPS (Roll Over Protective Structure)** available on all models. Enclosed cabs with EROPS rating available on some models.

Pneumatic Tire Compactor Features:

- **All wheel oscillation.** Front and rear tires provide even wheel loads regardless of evenness underfoot. PF models have front oscillation only.
- **High drive propel system (PS-150B, PS-200B, PF-290B, PS-360B).** Completely hydrostatic with drive motors and brakes located in mainframe away from contamination and damage.
- **Ballast compartments** are easily accessible for quick loading and are located to provide balanced wheel/weight ratio.
- **Single-lever hand control** of forward and reverse movement makes smooth rolling easy.
- **Adjustable wheel suspension (PF/PS-300B and PS-500)** adjusts ride to terrain and helps minimize bridging over gaps in base. PF models have rear suspension only.
- **Heavy-duty 3-speed powershift transmission (PF/PS-300B and PS-500)** provides forward or reverse propelling.
- **Steer wheels swivel individually (PF/PS-300B and PS-500)** preventing scuffing of material during turns, similar to automotive style steering.
- **Optional on-the-run tire inflation device** allows changing tire pressure during compaction.

NOTE: All models and options are not available in all markets.

[1]Steel ballast available.

The tables in this section give production estimates for the following assumed conditions:

Nominal machine travel speed: 6.4 kph (4.0 mph)
Overlap of rolling width: 15.2 cm (6.0 inches)

Table values give **representative** production rates for three common construction conditions: trenches, roads, and wide areas (> 15 m, or 50 ft).

Model	Drum Width cm	Drum Width in	Lift Thickness cm	Lift Thickness in	Passes Required		Production Estimates 3.7 m (12 ft) Trench	9.15 m (30 ft) Road Base	Wide Areas
CS-323C	127	50	10.2	4	6	m^3/hr	80	111	122

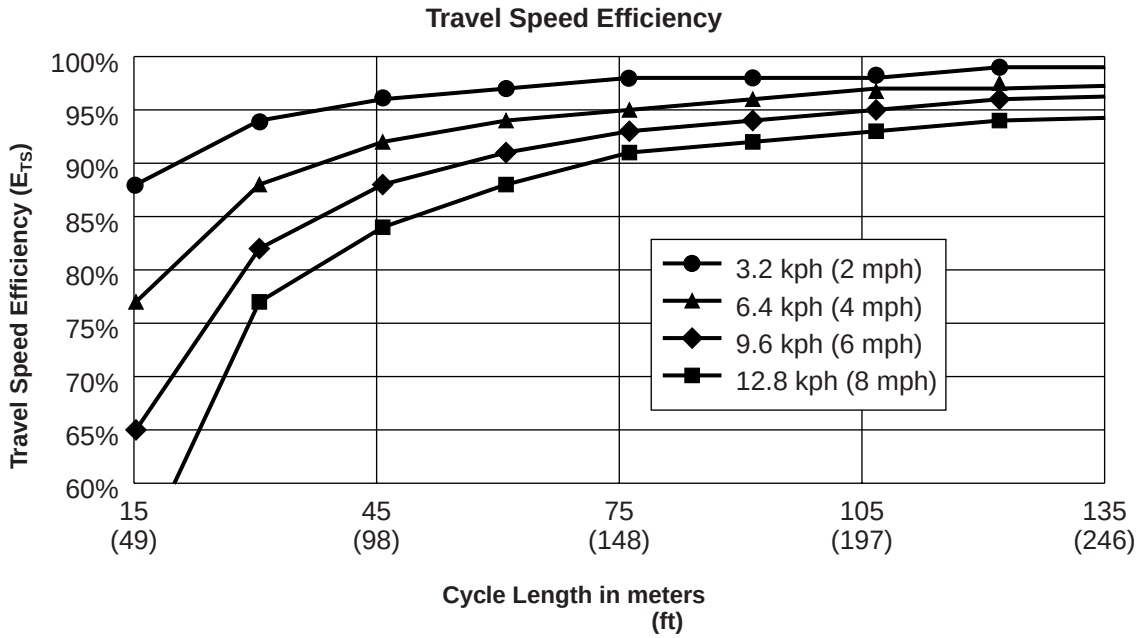
						yds^3/hr	626	626	847



Adjusting the Production Estimate

If the assumed conditions are not close to the actual construction conditions, the production estimates should be corrected. The production estimate from the table can be adjusted for 'actual' construction conditions by applying adjustment factors:

Q (actual) = Q (assumed) × Fs × Ft × Fp

Where: Q (actual) = adjusted productivity
Q (assumed) = productivity from table based on assumed conditions
Fs = adjustment for machine speed
Ft = adjustment for layer thickness
Fp = adjustment for no. of passes

The adjustment factors are determined by comparing the 'actual' conditions to the 'assumed' ones:

Fs = actual speed/assumed speed
Ft = actual thickness/assumed thickness
Fp = assumed passes/actual passes

Metric example

Actual Conditions — An 9.15-meter (full road width) base aggregate job is being completed with a compacted thickness of 15 cm. A CS-433C is being used, operating at 4.0 kph, and making 6 passes to achieve the desired compaction. The roller is overlapping its passes 6 inches.

For a 9.15-meter road base the table gives a CS-433C productivity of 249 m^3/hr. Since the speed, thickness, and passes are *different* from the assumed conditions, we should adjust this estimate:

	Assumed	Actual
Speed	6.4 kph	4.0 kph
Thickness	10.2 mm	15 mm
Passes	4 passes	6 passes

Fs = 4.0 kph/6.4 kph = 0.6
Ft = 15 cm/10.2 cm = 1.5
Fp = 4 passes/6 passes = 0.7

The estimated production is adjusted using these factors:

Q (actual) = 249 m^3/hr × 0.6 × 1.7 × 0.7
= 178 m^3/hr (233 yds^3/hr)

English example

Actual Conditions — An wide area commercial site development job is being compacted in lifts of 8 inches. A CP-563D is being used, operating at 4.0 mph, and making 4 passes to achieve the target density.

First, the table gives a CP-563D productivity of 847 yds^3/hr. Since lift thickness and passes required are *different* from the assumed conditions, we should adjust this estimate:

	Assumed	Actual
Speed	4.0 mph	4.0 mph
Thickness	12 inches	8 inches
Passes	6 passes	4 passes

Fs = no correction necessary
Ft = 8 inches/12 inches = 0.7
Fp = 6 passes/4 passes = 1.5

The estimated production is adjusted using these factors:

Q (actual) = 847 yds^3/hr × 0.7 × 1.5
= 890 yds^3/hr (680 m^3/hr)

Notes on Productivity:

- For jobs that are relatively narrow, especially road construction jobs, it is important to understand that certain widths of construction will be more productive than others for a given compactor. A productive construction width will make the most use of each side by side pass required by the compactor in order to cover the width.
- Production estimates should be adjusted further if the length of the compaction cycles are shorter than 75 m (250 ft). Refer to the Travel Speed Efficiency chart to determine efficiency E_{TS}. For example, a compactor traveling at 6.4 kph (4 mph) operating at cycle lengths of 150 ft has an E_{TS} of 0.91. Multiply Q (actual) by E_{TS}.

The table in this section gives production estimates for the following assumed conditions:

Compacted Layer Thickness	51 mm	**2 in**
Max. Propelling Speed	5.6 kph	**2.8 mph**
Passes per Machine Width	2	
Compacted Material Density	2486 kg/cm³	**155 pcf**
Overlap of Rolling Width	152 mm	**6 in**
Overhang at Lane Edge	76 mm	**3 in**
Cycle Time (2 passes)	**120 seconds**	

Table values give **representative** production rates for common construction widths. If the actual width falls between two assumed widths, use the higher number to estimate production. Minor adjustments can normally be made in the rolling method to reach this higher production: reduce overlap or overhang, increase speed, or increase the cycle time.

CB-634C	Tonnes/hr	322.9	258.3	322.9	387.5	322.9	369.0	415.1
	tons/hr	**355.9**	**284.7**	**355.9**	**427.1**	**355.9**	**406.8**	**457.6**

English example

Actual Conditions — A 12-foot lane is being paved with a compacted asphalt thickness of 4 inches. A CB-534C is being used, operating at 3.4 mph, and making 4 passes to achieve the target density. The roller is overlapping its passes 6 inches and is overhanging the edges by 3 inches.

First, the table gives a CB-534C productivity of 305.1 tons/hr for a 12 foot paving width. Since the actual speed, thickness, and passes are *different* from the assumed conditions, the estimate should be adjusted:

	Assumed	**Actual**
Speed	2.8 mph	3.4 mph
Thickness	2 inches	4 inches
Passes	2 passes	4 passes

Fs = 3.4 mph/2.8 mph = 1.2
Ft = 4 inches/2 inches = 2.0
Fp = 2 passes/4 passes = 0.5

The actual, or adjusted, production estimate can then be determined from the following:

Q (actual) = 305.1 tons/hr × 1.2 × 2.0 × 0.5
= 366.1 tons/hr (332.1 tonnes/hr)

Notes on Productivity:

- Higher speed usually results in lower density achieved per pass.
- Productivity on uphill slopes may be reduced.
- Tabulated production estimates assume that 1 pass is used for re-positioning the machine at the beginning of the next run.

The tables in this section give production estimates for the following assumed conditions:

	Hot Mix Asphalt		Soil and Aggregate		Cold In-Place Recycled Asphalt	
Compacted Layer Thickness	51 mm	**2 in**	152 mm	**6 in**	203 mm	**8 in**
Max. Propelling Speed	8 kph	**5 mph**	8 kph	**5 mph**	4.8 kph	**3 mph**
Passes per Machine Width	**4**		**4**		**6**	
Compacted Material Density	2486 kg/cm^2	**155 lb/ft^2**	2085 kg/cm^2	**130 lb/ft^2**	2246 kg/cm^2	**140 lb/ft^2**
Overlap of Rolling Width	152 mm	**6 in**	152 mm	**6 in**	152 mm	**6 in**
Overhang at Lane Edge	76 mm	**3 in**	76 mm	**3 in**	76 mm	**3 in**
Cycle Time (2 passes)	**120 seconds**		**120 seconds**		**120 seconds**	

Table values give **representative** production rates for common construction widths. If the actual width falls between two assumed widths, use the higher number to estimate production. Minor adjustments can normally be made in the rolling method to reach this higher production: reduce overlap or overhang, increase speed, or increase the cycle time.

	tons/hr	**589.6**	**423.3**	**529.2**	**635.0**	**740.8**	**579.3**	**651.7**

Metric example

Actual Conditions — An 7.3-meter (full road width) base aggregate job is being completed with a compacted thickness of 200 mm. A PS-200B is being used, operating at 6.5 kph, and making 6 passes achieve the desired compaction. The roller is overlapping its passes 6 inches.

First, the table does not show production for 7.3 meters so use the greatest width on the table: 5.5 meters. The table gives a PS-200B productivity of 778.4 tonnes/hr for this paving width. We can expect that the actual productivity for 7.3 meters will be slightly higher than that. Since the speed, thickness, and passes are *different* from the assumed conditions, we should adjust this estimate:

	Assumed	Actual
Speed	8 kph	6.5 kph
Thickness	152 mm	200 mm
Passes	4 passes	6 passes

Fs = 6.5 kph/8 kph = 0.8
Ft = 200 mm/152 mm = 1.3
Fp = 4 passes/6 passes = 0.7

The estimated production is adjusted using these factors:

Q (actual) = 778.4 tonnes/hr × 0.8 × 1.3 × 0.7
= 567 tonnes/hr (625 ton/hr)

Notes on Productivity:

- Ballast weight and tire pressure can significantly affect performance of a pneumatic tire compactor. Refer to machine selection guide to choose the best configuration.
- Productivity on uphill grades and very thick layers (>127 mm, or 5 in) may be reduced due to a necessary reduction in speed.
- The 11-tire configuration for the PS-150B is designed only for chip-and-seal applications. It is not recommended in other applications.

ELPHINSTONE UNDERGROUND MACHINES
Loaders and Haulers for Hard Rock Mining

CONTENTS

Elphinstone machines:

- Produced by a fully owned Caterpillar Inc. subsidiary.
- Manufactured in Burnie, Tasmania (Australia).
- Supported by the worldwide Caterpillar parts and dealer network.

Features, all models:

- Rugged design for underground application.
- Caterpillar diesel engines and power trains.
- High proportion of Caterpillar parts.
- Extensive use of steel castings and forgings.
- Engineered for productivity, reliability, safety, and machine rebuildability.
- Remote control options on loaders.

Elphinstone product line:

- Six models of Load-Haul-Dump (LHD) machines, with rated bucket payloads ranging from 6.5-20 tonnes (7 to 22 tons).
- Dump and ejector versions of articulated trucks, with payload capacities of 40-55 tonnes (44-60 tons).
- Three models of rigid frame trucks; dump versions with 38 tonne (42 tons) and 52 tonne (58 tons) payload capacity; ejector version with 36 tonne (40 tons) payload capacity.

HYDROMECHANICAL WORK TOOLS

CONTENTS

HYDRAULIC HAMMERS

H45-H100 Hammer Features:

- **Low Pressure Accumulator** provides the energy for the piston power stroke.
- **Custom Side Plates** designed for Caterpillar carrier geometry. Protects power cell. Allows for complete folding of the boom on side-shift backhoes.
- **High Pressure Accumulator** dampens pressure peaks and pulsation, thus protecting carrier hydraulic system. Recovers rebound energy in hard material for greater impact power.
- **Distributor** has high oil volume for ultra high blow frequency.
- **Pressure Adjusting Valve** assures that all blows are delivered at a constant blow energy.
- **Long Heavy Piston** delivers maximum impact energy and minimizes recoil forces to carrier.
- **Long Front End** ensures proper piston — tool alignment.
- **Slip Fit Thrust Ring** dissipates harmful shock loads in abusive applications and is rotatable for additional life.
- **Slip Fit Upper Tool Bushing** is rotatable for additional life and provides positive tool alignment.
- **Slip Fit Lower Tool Bushing** provides positive tool alignment, is field replaceable and rotatable. Grease retention grooves provide extended lubrication and wear indication.
- **Sound suppressed** versions available for all models.

H115s-H180s Hammer Features:

- **Shock Mount** isolates forces to protect the carrier.
- **Integrally Mounted Accumulator** dampens pressure peaks inside the hammer to protect the carrier hydraulic system, and assist the piston in the power stroke.
- **Pressure Control Valve** allows hammer to strike with maximum fixed energy per blow.
- **Main Valve** directs the firing cycle and blocks the return port to protect the carrier hydraulics from pressure peaks.
- **Check Valve** maintains oil pressure in the accumulator when hammer is repositioned. This helps improve breaking efficiency (reduced waiting time).
- **Tie Rods** are heat torqued for easier tightening without torsion stresses.
- **Long Heavy Piston** minimizes recoil forces to protect hammer components and carrier structures.
- **Slip Fit Thrust Ring** dissipates shock loads in abusive applications and is rotatable for longer life.
- **Plastic Wear Plates** on all four sides guide the power cell within the housing.
- **Slip Fit Upper Tool Bushing** is rotatable for longer life and is replaceable. Guides the tool to optimize in-line piston/tool contact.
- **Slip Fit Sealed Lower Tool Bushing** provides positive tool alignment, is field replaceable and rotatable. It has grease retention grooves for extended lubrication and wear indication.
- **Sound Suppression** consists of housing noise dampening material, plugs and covers.
- **Autolube** available for all hammers.

Hammer Applications

- **Sewer and Water** — The hammer can be used on pockets of rock that slow down production. Also good for breaking up old concrete pipes, manholes, etc.
- **Road Construction** — An essential tool during improvements and upgrading. The hammer works well on removing existing curbs, traffic islands, ramps, or sections of concrete. With correct tool, it can cut asphalt.
- **Bridge Renewal** — Hammers are used to remove old bridge surfaces, railing supports, abutments, retaining walls, etc.
- **Demolition** — The hammer-equipped excavator is often a key helper in industrial demolition. It can break up fallen wall and floor sections as well as foundations, or other brick and concrete structures.
- **Mining and Aggregate** — Hammers can break oversized material to avoid secondary blasting, and size riprap. Hammers can be installed near crushers to prepare material for crushing.
- **Trenching/Primary Excavation** — In soft or layered materials, the hydraulic hammer with a moil or chisel point is an effective tool in excavation.
- **Direct Quarrying** — In many types of limestone, direct quarrying with hydraulic hammers can prove cost effective, especially where blasting is prohibited or restricted.

A hammer need not be full time attachment for these applications. It can be replaced by a bucket in a short time, allowing the machine to be used for digging, loading, lifting, or other tasks.

Consult your Caterpillar dealer for advice on correct sizing, installation and tool selection.

NOTE: Internal components of hammers are machined to close tolerances and require clean oil with full lubricating properties. Hammers are sensitive to hot oil and need higher viscosity oil than the carrier. Hammers tend to shear multigrade mineral oil so that oil viscosity decreases. Contamination, water in oil, and decreased viscosity lead to earlier oil deterioration and the need for more frequent oil changes than normally recommended for the excavator. Extra care should be taken to avoid the entry of dust or dirt when installing or removing a hammer in the field.

Principles of Selection

Key to the successful sale of a hammer is proper hammer selection.

Background Information

Collection of background information is the first step. The following information will assist in being sure the customer receives the correct hammer and that he has a positive hammer experience. The following issues should be examined.....

1. If any, what brand and model hammer was previously used and how did the hammer perform?
2. What % of time will the hammer be used on the machine?
3. Will the hammer be used in primary breaking or secondary breaking? (mainly an issue for large hammers)
4. What machine will the hammer be used on and what are the hydraulic flow and pressures of this machine?
5. What is the type of material to be broken and production required from the hammer? (best to obtain this from the end user but a table is available at the end of this section)

Hammer Selection Process

1. Using Cat carrier matching matrix on next page identify 2 or 3 possible hammers for your application (for competitive carriers use carrier weight class as reference).
2. Compare machine/carrier flow and pressures to those of the hammer candidates to validate compatibility. Eliminate hammers outside carrier specs.
3. Compare previous hammer energy rating and weight to candidate hammers..... if contractor had problems or marginal production with previous hammer consider a slightly larger hammer (note: only use CIMA energy rating and not a generic size class).
4. If hammer is to be used in primary breaking consider larger of hammer candidates.
5. Check productivity guidance tables at the back of this section. Identify hammer most compatible with requirements.
6. Determine if the application requires special hammer modifications, i.e. steel mill, underwater, tunneling, etc.

Other Issues

Once the hammer has been chosen, other elements need to be considered to have a successful hammer experience.

1. Select the correct hammer tool for the application (see tool application chart in this section).
2. Check to be sure the correct hammer bracket and hoses are specified. Be sure correct carrier oil is specified for hammer use (particularly important in high ambient areas).
3. Consider supplemental carrier cooling in areas of high ambient temperature.

Actual operating pressure and back pressure MUST be checked when the hammer is fitted to the carrier (just as important if the hammer goes on a competitive carrier or is installed by the contractor at his shop).

These matches are for general reference purposes for Cat machines only. When special boom and quick coupler arrangements are in use, these matches may not apply. When matching hammers to competitive carriers, selection should be made by carrier weight. Refer to the carrier weight range at the top of the table in order to determine the correct match.

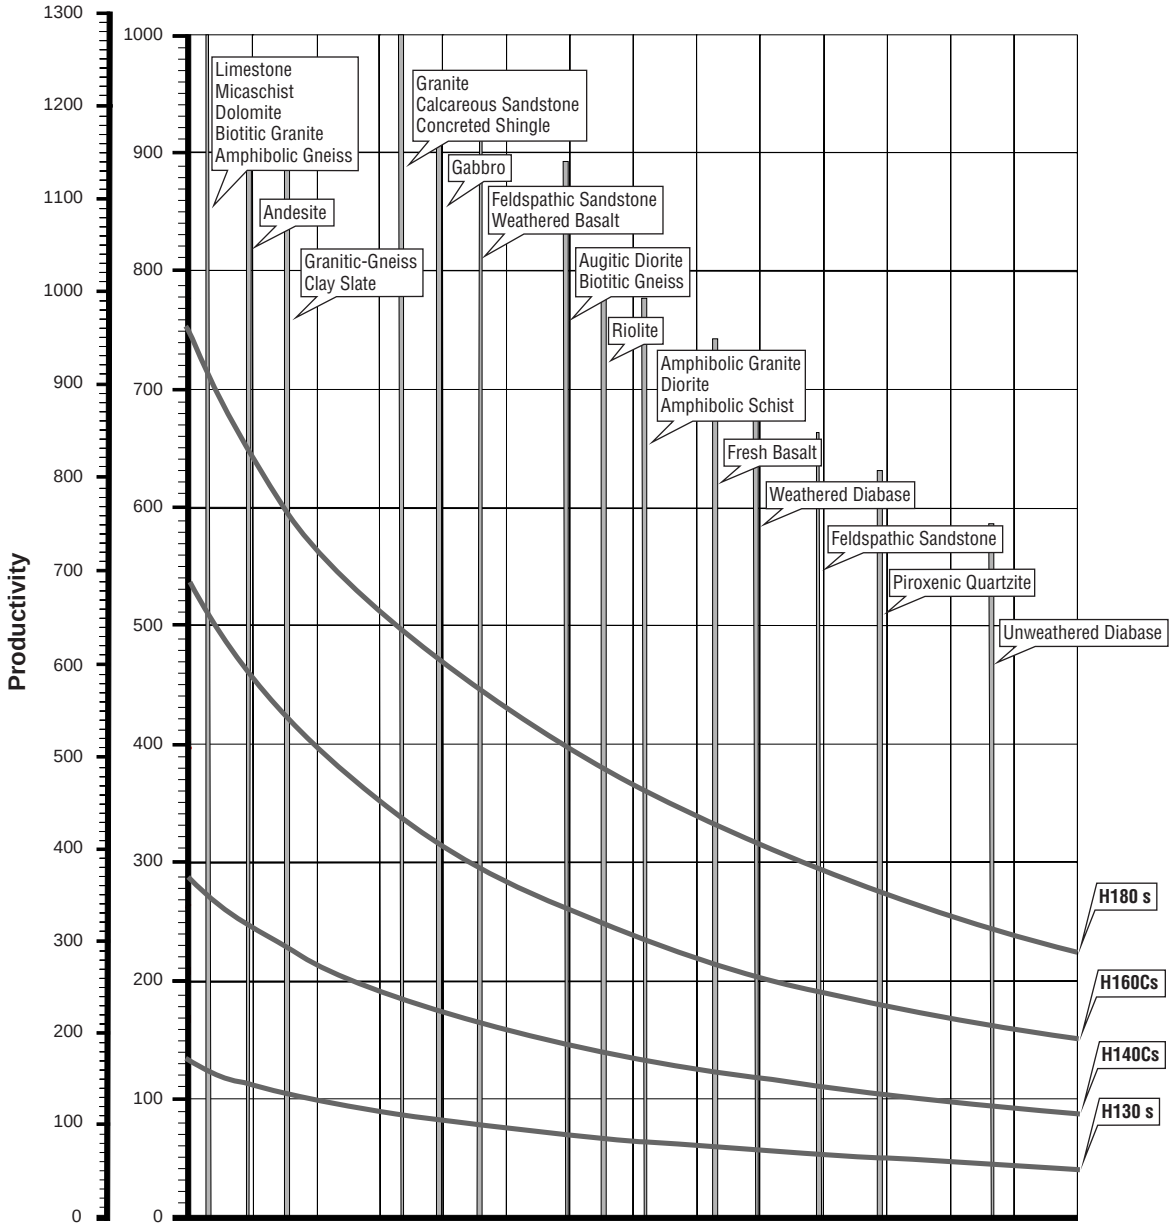
Production rates listed are based on 8-hr shift

The above figures are for general estimation purposes only and must not be used to guarantee any production figure to the customer. The actual working results may vary according to the quality and structure of the material to be broken, required degree of material size reduction, installation, condition of the carrier, conditions at the worksite, haulage of the broken material, skills of the operator etc.

The figures are for comparison and evaluation purposes only. Results will vary depending on operator, carrier and job conditions.



Bedding thickness 100-200 cm (40-80") or closely spaced vertical fractures

MOBILE SCRAP AND DEMOLITION SHEARS

Features:

- 180 degree side mounted rotation.
- Precision machined main bolt is field removable.
- 500 Brinell hardness wear plates throughout the upper and lower jaw.
- Hydraulic cylinder rod is protected. When activated the cylinder barrel is pushed out and the rod remains protected by the housing at all times.
- Transportation safety bars are designed to convert the shears to straight shears if the rotator is down for repair or overhaul.

Applications:

The Cat Mobile Scrap and Demolition Shears are widely used for demolishing steel structures, cutting up cars, trucks, farm machinery, railroad cars, large rubber tires, reinforced concrete structures, cables and scrap in general.

CONCRETE PULVERIZERS

Features:

- Hydraulic cylinder rod is protected. When activated the cylinder barrel is pushed out and the rod remains protected by the housing at all times.
- Large diameter slewing ring powered by a hydraulic motor constitutes a rugged and fast 360 degree rotation system.
- P16 and P25 Pulverizers provide the optimum reach configuration. Fifteen replaceable teeth and two square shaped cutting knives.
- P20, P28, P40 and P60 provide the optimum productivity configuration. Twenty-one replaceable teeth with six replaceable square cutting knives.
- Patented staggered tooth design enhances crushing effectiveness of the jaws.
- Long powerful rebar cutters.

Applications:

Primary and secondary demolition in one operation. Ideal for reinforced concrete found in bridge decks, parking garages, support columns and abutments.

CONCRETE CRUSHERS

Features:

- Two powerful hydraulic cylinders protected from damage by the unique static rod design.
- Each crushing arm has two cutters and two crushing teeth.
- Replaceable cutters and teeth are bolted and tack welded to the jaw.
- Rebar cutters have four cutting edges.
- Large diameter slewing ring powered by a hydraulic motor constitutes a rugged and fast 360 degree rotation system.

Applications:

Primary demolition where productivity is crucial, reinforced concrete structures with thick walls and large diameter columns. Also used on bridge decks, parking garages, support columns and abutments with a thickness of up to five feet.

MULTI-PROCESSORS

Features:

- **Wide selection** of interchangeable jaws.
- **Lifting eye placement** and adjustable stop bolts allow quick jaw changes.
- **Single, large diameter** cross mounted cylinder provides exceptional cutting and crushing force.
- **Jaws are manufactured** of high quality tool steel with outstanding tensile strength.
- **Non impact** tools that work at a relatively low noise level.

Applications:

The Cat Multi-Processors can be used to accomplish most tasks on a demolition job. One common housing with a wide selection of interchangeable jaws allows the tool to cut, crush or pulverize the toughest of materials. Highly reinforced concrete, structural steel beams, pipes, cable, steel plate and storage tanks.

Matching Guide

Stick Mounted/Reach Boom

Multi-Processors Model	Cat Excavator	Stick Range m	Stick Range ft
MP15	320B	1.9-3.9	**6'3"-12'10"**
	322B	3.6	**11'10"**
MP20	322B	2.5-2.95	**8'2"-9'8"**
	325B	2.7-3.2	**8'10"-10'6"**
	330B	3.3-3.9	**10'10"-12'10"**

Note: Matching guide for all Multi-Processor and Jaw configurations. Tank Shear Jaws are not available for MP15.

CATERPILLAR MULTI-PROCESSOR INTERCHANGEABLE JAWS

Concrete Cutter Jaws (CC)

- For precise demolition/cutting of heavily reinforced concrete structures.
- Cuts structural steel and pipe.
- Equipped with replaceable concrete crusher teeth and reversible steel cutting knives.

Shear Jaws (S)

- For demolition of steel structures.
- Cuts angle and channel iron, beams, pipe, rebar, cable and tires.
- Knives are reversible.

Tank Shear Jaws (TS)

- Quickly cuts steel plate on barges, railway cars, grain, water, oil, and fuel tanks. Dual knives on the moving and static jaws produce smooth, straight edges.
- All knives are reversible.
- Available for MP20 only.

Crusher Jaws (CR)

- For demolition of moderately reinforced concrete structures. Capable of crushing concrete and cutting rebar.
- Replaceable crusher teeth and reversible knives.

Primary Pulverizer Jaws (PP)

- Combines capability to demolish and recycle moderately reinforced concrete structures. Pulverizes concrete, cuts rebar and separates rebar from concrete.
- Replaceable crusher teeth and reversible knives.

Secondary Pulverizer Jaws (PS)

- Recycles demolished concrete by pulverizing concrete, separating concrete and rebar, and cutting rebar as needed.

All jaw sets can be interchanged quickly with the lifting eyes and the adjustable stop-bolts on jaws and body.

DESIGN DATA

Diesel Engines

Bearings — Precision-type steel-backed aluminum alloy with lead-tin overlay copper bonded to bearing surface. High load carrying ability and exceptional fatigue strength.

Block — Cast from high tensile strength grey iron. Internal ribbing provides added strength.

Cooling — Built-in, gear driven centrifugal pump (belt driven for 3116 and 3208) circulates jacket water through engine at all times. Water temperature is thermostatically controlled. Heat exchangers and radiators are available.

Crankshaft — Forged steel, dynamically balanced, heat treated and superfinished.

Cylinder Liners — Internal surface induction hardened (1.7 L, 3300, 3400, 3500 and 3600 Families) for excellent wear life. Full-length watercooled for efficient heat transfer.

Fuel System — Adjustment free for reduced engine maintenance, individual fuel injection pumps have built-in calibration — no adjustment required after fuel nozzle replacement (1.7 L, 1.9 L, 3406E, 3456, 3500 and 3600 families have unit injectors). 3126, 3408E and 3412E use the Caterpillar Hydraulic Electronic Fuel Injection (HEUI) system.

Governor — Hydra-mechanical (Woodward 3161 on 3500 and 3600 Families) for reliability, good response and smooth, stable load changes. Electronically controlled engines use Caterpillar proprietary software and hardware.

Lubrication — Positive displacement gear pump maintains continuous flow of lubricant under pressure to all moving parts. Full-flow filtration is provided by replaceable cellulose filters. Watercooled oil cooler maintains proper oil temperature.

Pistons — Three-ring design (two-ring on 3208) reduces friction, provides excellent oil control, and increases engine efficiency.

Starting — Electric and air starting systems are offered for most models.

Valves — Hardened steel alloy. Valves rotate 3° each time they lift to seat in a new position and allow even heat distribution (except for 3116).

Gaseous Fueled Engines

Combustion System — The piston design and compression ratios available provide the ability to utilize a wide variety of gaseous fuels as well as provide low emission output (below 2.0 grams/bhp-hr No_x).

Fuel System — Heavy-duty, industrial-type carburetors designed to maintain optimum air-fuel ratio at all loads and speeds.

Ignition System — Caterpillar Gaseous Fueled Engines employ a low tension magneto, together with an ignition transformer (one at each cylinder), to provide up to 34 kV to spark plugs. The Cat Electronic Ignition system is also available on certain engines.

RATING EXPLANATIONS

All engine ratings listed include such standard accessories as air cleaner and fuel, lube, and jacket water pumps. Power required for auxiliaries such as cooling fans, air compressors, charging alternators, special pumps, etc., must be deducted to arrive at the net power available to drive the load (except as noted). Other ratings are available for specific application and customer requirements, i.e., locomotive, oil field, fire pump, irrigation, etc. Consult your Caterpillar Dealer.

Rating Conditions

Performance is based on SAE J1995 standard conditions of 100 kPa (29.61 in Hg) and 25°C (77°F). Performance also applies at ISO 3046/1 (except for Spark Ignited Engines), DIN 6271 and BS 5514 standard conditions of 100 kPa (29.61 in Hg), 27°C (81°F) and 60% relative humidity.

Fuel consumption is based on fuel oil having an LHV of 42 780 kJ/kg (18,390 Btu/lb) and weighing 838.9 g/liter (7.001 lb/U.S. gal). All ratings are based on distillate fuel.

Altitude and Temperature Capabilities

Industrial Diesel Engines — Most intermittent and continuous ratings are applicable to at least 1320 m (5000 ft) elevation without derating. Consult factory for specific applications.

Gaseous Fueled Engines — Ratings for turbocharged and aftercooled engines are generally applicable to 1500 m (5000 ft). Naturally aspirated engines are applicable to 150 m (500 ft).

Diesel Truck Engines — Refer to specification sheets for altitude capability of individual truck engine ratings.

DITA — Direct Injection Turbocharged-Aftercooled
DITTA — Direct Injection Twin Turbocharged-Aftercooled

Rating Definitions:

NOTE: Application examples are for reference only. For an exact determination of the appropriate rating, contact the factory or your local Caterpillar Dealer.

Rating conditions:

All ratings are based on SAE J1349 standard ambient conditions of 100 kPa **(29.6 in Hg)**, 30% relative humidity and 25°C **(77°F)**. Ratings also apply at AS1501, BS5514, DIN6271 and ISO3046/1 standard conditions.

Power is based on API gravity of 35 at 15°C **(60°F)**, fuel having a LHV of 42 780 kJ/kg **(18,390 Btu/lb)** used at 29°C **(84°F)** with a density of 838.9 g/L **(7.001 lb/U.S. gal)**.

Ratings are the total output capability of the engine equipped with standard accessories: lube oil, fuel oil and jacket water pumps.

A Rating (Continuous):

- For heavy-duty services when engine is operated at rated load and speed up to 100% of the time without interruption or load cycling.
- Time at full load up to 100% of the duty cycle.
- Typical application examples include pipeline pumping, ventilation.

B Rating:

- For service where power and/or speed are cyclic.
- Time at full load not to exceed 80% of the duty cycle.
- Typical application examples include irrigation where normal pump demand is 85% of engine rating, oil field mechanical pumping/drilling, stationary/plant air compressors.

C Rating (Intermittent):

- For service where power and/or speed are cyclic. Horsepower and speed capability of the engine can be utilized for one uninterrupted hour followed by one hour of operation at or below the A rating.
- Time at full load not to exceed 50% of the duty cycle.
- Typical application examples include agricultural tractors, harvesters and combines, truck off-highway, fire pumps, blast hole drills, rock crushers, wood chippers with high torque rise, oil field hoisting, and portable air compressors.

D Rating:

- For service where rated power is required for periodic overloads. The maximum horsepower and speed capability of the engine can be utilized for a maximum of 30 uninterrupted minutes followed by one hour at the C rating.
- Time at full load not to exceed 10% of the duty cycle.
- Typical application examples include offshore cranes, runway snow blowers, water well drills, and fire pump certification power.

E Rating:

- For service where rated power is required for a short time for initial starting or sudden overload. For emergency service where standard power is unavailable. Horsepower and speed capability of the engine can be utilized for a maximum of 15 uninterrupted minutes followed by one hour at the C rating or duration of emergency.
- Time at full load not to exceed 5% of the duty cycle.
- Typical application examples include standby centrifugal water pumps, oil field well servicing, crash trucks and gas turbine starters.

Rating Definition:

Standby: Fire pump engine ratings represent the output which may be utilized to drive stationary fire pumps where the pumping equipment has been sized according to ULI and FM procedures.

(Continued on next page)

Rating Definitions: (except 3600s)

A: For use with little load cycling in oceangoing displacement hulls such as freighters, tugboats and bottomdrag trawlers, and deep river towboats.

B: For use in midwater trawlers, purse seiners, crew and supply boats, ferry boats with trips longer than one hour, and towboats in rivers where locks, sandbars, curves or traffic dictate frequent slowing.

C: For use in yachts with displacement hulls, as well as ferries with trips less than one hour, fish boats with higher speed journey out and back (e.g., some lobster, crayfish and tuna), and short trip coastal freighters.

D: For use in patrol, customs, police boats, and some fire boats. Also for bow/stern thrusters.

E: For use in pleasure craft with planing hulls, as well as for patrol, pilot and harbor master boats.

TA — Turbocharged-Aftercooled

RATING DEFINITIONS: (3600s)

CS: Continuous Service is suitable for continuous duty applications, including dredges, for operation without interruption or load cycling.

MC: Maximum Continuous is generally used for vessel applications involving varying loads. The engine power actually produced is limited by application guidelines, leaving a power reserve for unusual operating conditions.

Rating Definition:

Prime power for continuous electrical service — capable of 10% overload. Marine generator ratings are based on 90°C **(194°F)** temperature rise for the generator.

Rating conditions:

Ratings are based on SAE J3046 and J1349 standard conditions of 100 kPa **(29.61 in Hg)** and 25°C **(77°F)**. These ratings also apply at ISO8665, ISO30461/1, DIN6271, and BS5514 standard conditions of 100 kPa **(29.61 in Hg)**, 27°C **(81°F)** and 60% relative humidity.

Fuel rates are based on fuel oil of 35°API [16°C **(60°F)**] gravity having an LHV of 42 780 kJ/kg **(18,390 Btu/lb)** when used at 29°C **(85°F)** and weighing 838.9 g/liter **(7.001 lbs/U.S. gal)**.

* Power transmitted through dry tape flywheel clutch to selective type hinge speed gear set.
** Power transmitted through flexible and over center engagement, dry flywheel clutch with metallic friction surfaces. Selective type change speed gear set.
† Approximate operating weight. Includes lubricants, coolant, full fuel tank, hydraulic control, 8S Bulldozer, ROPS canopy and operator.
All other weights listed in this column are shipping weights.
NOTE: Power Shift models show speeds only, not drawbar pull.
NOTE: Track-Type Tractor weights do not include blades until 1967.

* Gauge of both tractors combined.
** Width to outside of dozer blade.
◀ Length including dozer blade.
◀◀ Overall height excluding stack and canopy.
• Approximate weight of both machines plus Bulldozer, hydraulic controls, coolant and 5% fuel. (D10, D11N, D11R includes SS ripper)

NOTE: Power Shift models show speeds only, not drawbar pull.
NOTE: Track-Type Tractor weights do not include blades until 1967.

*Drawbar pull figures for SA and SR models are max. at lug.

NOTE: Drawbar pull figures for the Challenger 65 is at max. power as found in University of Nebraska Tractor Test no. 1268. This test was performed on concrete. Therefore, usable drawbar pull may be less depending upon soil conditions.

*Drawbar pull figures for SA and SR models are max. at lug.

NOTE: Drawbar pull figures for the Challenger 65 is at max. power as found in University of Nebraska Tractor Test no. 1268. This test was performed on concrete. Therefore, usable drawbar pull may be less depending upon soil conditions.

ESTIMATING OWNING & OPERATING COSTS

CONTENTS

General

Machine users must balance Productivity and Costs to achieve optimum performance ... that is, achieve the desired production at the lowest possible cost. The approach most often used to measure machine performance is this simple equation:

$$\frac{\textit{Lowest Possible Hourly Costs}}{\textit{Highest Possible Hourly Productivity}} = \textit{Top Machine Performance}$$

Most sections of this Handbook deal with the productivity of Caterpillar machines. This section considers the cost aspect of performance.

Hourly Owning and Operating Costs for a given machine can vary widely because they are influenced by many factors: the type of work the machine does, local prices of fuel and lubricants, shipping costs from the factory, interest rates, etc. No attempt is made in this handbook to provide precise hourly costs for each model. Users must be able to estimate with a reasonable degree of accuracy what a machine will cost per hour to own and operate in a given application and locality. Therefore, this section provides a suggested method of estimating hourly owning and operating costs as well as data on Caterpillar-built machines which, when coupled with local conditions, will permit accurate estimates.

The method suggested follows several basic principles:

- No prices are provided for any items. For reliable estimates, these must always be obtained locally.
- Calculations are based on the complete machine. Separate estimates are not necessary for the basic machine, dozer, control, etc.
- The multiplier factors provided will work equally well in any currency expressed in decimals.
- Because of different standards of comparison, what may seem a severe application to one machine owner may appear only average to another. Therefore, to better describe machine use, operating conditions and applications are defined in zones.
- Unless otherwise specified, the word "hour" when used in this section means clock or operating hours, not Service Meter Units.

HOURLY OWNING AND OPERATING COST ESTIMATE

1-7 ESTIMATING OWNING COSTS

(Line Items 1 through 7)

To protect his equipment investment and be able to replace it, the machine owner must recover over the machine's useful life an amount equal to the loss in resale value plus the other costs of owning the equipment including interest, insurance and taxes.

The machine owner, for accounting purposes, estimates resale value loss in advance, and recovers his original equipment investment by establishing depreciation schedules according to the various uses of the equipment. Proper financial and tax assistance is highly recommended when establishing depreciation schedules.

The machine depreciation method suggested in this handbook is not based on or related to any tax considerations, but rather is a simple straight line write-off based solely on the number of years or hours the owner expects to use the machine gainfully. Considering today's economic conditions worldwide and the trend toward larger, more expensive equipment, many users choose to keep these units on the job well after they have been fully depreciated for tax purposes. On the other hand, tax incentives in many areas may favor trading a machine well before it approaches the limits of its useful life.

Accordingly, it is imperative that careful consideration be given the selection of depreciation periods, and that for owning and operating cost calculations they be based on useful life rather than tax write-off life. The table of machine operating conditions (next page) only suggests such useful life periods in clock or operating hours. Recognize, however, that factors other than operating conditions can influence machine depreciation periods — an owner's wish to accelerate recovery of his investment, purchase of a machine for a job of specific duration, local customs, local economic conditions, availability of foreign exchange to buy a replacement, and many others.

Maintenance practices are not considered in this table but play an important part in determining economic machine life. For example, operating conditions may suggest a 12,000 hour depreciation period for a machine, but poor maintenance could make it uneconomical to retain the unit beyond 10,000 hours. Good, regular maintenance often can extend economical machine life.

Therefore, a knowledge of the intended use, operating conditions and maintenance practices, plus any special factors, is essential in establishing expected machine life for depreciation purposes.

GUIDE FOR SELECTING OWNERSHIP PERIOD BASED ON APPLICATION AND OPERATING CONDITIONS

	ZONE A Moderate	ZONE B Average	ZONE C Severe
TRACK-TYPE TRACTORS	Pulling scrapers, most agricultural drawbar, stockpile, coalpile. No impact. Intermittent full throttle operation.	Production dozing in clays, sands, gravels. Pushloading scrapers, borrow pit ripping, most landclearing applications. Medium impact conditions. Production landfill work.	Heavy rock ripping. Pushloading and dozing in hard rock. Work on rock surfaces. Continuous high impact conditions.
D3C-D5C	10,000 Hr	8,000 Hr	NA
D5M-D6M	15,000 Hr	12,000 Hr	NA
D6R-D7R	20,000 Hr	15,000 Hr	10,000 Hr
D8R	25,000 Hr	20,000 Hr	15,000 Hr
D9R	35,000 Hr	25,000 Hr	20,000 Hr
D10R/D11R	50,000 Hr	40,000 Hr	30,000 Hr
AGRICULTURAL TRACTORS	Pulling combines, grain wagons and grain carts.	Pulling field cultivators, moldboard plows, chisel plows, discing, primary and finishing tillage.	Pulling layer scrapers, used in construction applications, ripping, dozing.
CHALLENGER 35, 45 & 55	10,000 Hr	8,000 Hr	N/A
CHALLENGER 65E-95E	12,000 Hr	10,000 Hr	8,000 Hr
'SR' TRACTORS	14,000 Hr	12,000 Hr	10,000 Hr
MOTOR GRADERS	Light road maintenance. Finishing. Plant and road mix work. Light snowplowing. Large amounts of traveling.	Haul road maintenance. Road construction, ditching. Loose fill spreading. Landforming, landleveling. Summer road maintenance with medium to heavy winter snow removal. Elevating grader use.	Maintenance of hard packed roads with embedded rock. Heavy fill spreading. Ripping-scarifying of asphalt or concrete. Continuous high load factor. High impact.
120H Thru 16H	20,000 Hr	15,000 Hr	12,000 Hr
24H	40,000 Hr	35,000 Hr	30,000 Hr
EXCAVATORS	Utility construction, low density material, rehandling and scrap handling applications.	Continuous digging in sandy clay/sandy gravel, site development and lumber yard applications.	Continuous digging in rock/natural bed clay, high impact, using hammer, working in forests or quarries.
M312-M320, 307B	10,000 Hr	8,000 Hr	6,000 Hr
311B-318B L	12,000 Hr	10,000 Hr	8,000 Hr
EXCAVATORS	Shallow depth utility construction where excavator sets pipe and digs only 3 or 4 hours/shift. Free flowing, low density material and little or no impact. Most scrap handling arrangements.	Mass excavation or trenching where machine digs all the time in natural bed clay soils. Some traveling and steady, full throttle operation. Most log loading applications.	Continuous trenching or truck loading in rock or shot rock soils. Large amount of travel over rough ground. Machine continuously working on rock floor with constant high load factor and high impact.
320B, 322B	15,000 Hr	12,000 Hr	10,000 Hr
325B, 330B	15,000 Hr	12,000 Hr	10,000 Hr
345B, 365B, 375	20,000 Hr	18,000 Hr	15,000 Hr
5000 SERIES EXCAVATORS	Continuous loading in loose banks or stockpile. Good underfoot conditions. (Might be considered similar to "normal" wheel loader conditions.)	Continuous loading in well-shot rock or fairly tight bank. Good underfoot conditions; dry floor, little impact or sliding on undercarriage.	Continuous loading in poorly-shot rock, virgin or lightly-blasted tight banks. Adverse underfoot conditions: rough floors; high impact sliding on undercarriage.
5080	20,000 Hr	18,000 Hr	15,000 Hr
5110B	30,000 Hr	25,000 Hr	30,000 Hr
5130B & 5230	50,000 Hr	40,000 Hr	30,000 Hr

	ZONE A Moderate	ZONE B Average	ZONE C Severe
FELLER BUNCHERS	Continuous felling and stacking in good underfoot conditions. Flat ground uniform trees below 305 mm (12 inches).	Continuous cycling in good underfoot conditions. Rolling terrain, some trees up to 508 mm (20 inches) or some hardwoods.	Continuous cycling in steep terrain over stumps and fallen trees. Most trees 508 mm (20 inches) or larger hardwoods.
	18,000 Hr	15,000 Hr	10,000 Hr
BACKHOE LOADERS	Light duty utility applications in light to medium soil. Trenching depths less 1.83 m (6 ft.)	Utility applications in medium to heavy soil. Occasional use of constant flow implements. Dig depths to 3.05 m (10 ft.)	Production applications or digging in rock. Regular use of constant flow implements. Dig depths over 3.05 m (10 ft.)
	12,000 Hr	10,000 Hr	5,000 Hr
FOREST PRODUCTS	Intermittent skidding for short distances, no decking. Good underfoot conditions: level terrain, dry floor, few if any stumps.	Continuous turning, steady skidding for medium distances with moderate decking. Good underfooting: dry floor with few stumps and gradual rolling terrain.	Continuous turning, steady skidding for long distances with frequent decking. Poor underfoot conditions: wet floor, steep slopes and numerous stumps.
Harvesters	*	*	*
Forwarders	*	*	*
Wheel Skidders	10,000 Hr	8,000 Hr	7,200 Hr
Track Skidders	12,000 Hr	10,000 Hr	8,000 Hr
Forestry Machine	*	*	*
Knuckleboom Loaders	*	*	*
PIPELAYERS	Little or no use in mud, water or on rock. Use on level, regular surfaces.	Typical pipelayer use in operating conditions ranging from very good to severe.	Continuous use in deep mud or water or on rock surfaces.
561M-572R	20,000 Hr	15,000 Hr	10,000 Hr
583R-589	25,000 Hr	20,000 Hr	15,000 Hr
WHEEL TRACTOR-SCRAPERS	Level or favorable hauls on good haul roads. No impact. Easy-loading materials.	Varying loading and haul road conditions. Long and short hauls. Adverse and favorable grades. Some impact. Typical road-building use on a variety of jobs.	High impact condition, such as loading ripped rock. Overloading. Continuous high total resistance conditions. Rough haul roads.
613C Series II, 611, 615C Series II	12,000 Hr	10,000 Hr	8,000 Hr
621G-627G, 631E-657E	22,000 Hr	17,000 Hr	12,000 Hr
CONSTRUCTION & MINING TRUCKS & TRACTORS	Continuous operation at an average gross weight less than recommended. Excellent haul roads. No overloading, low load factor. (See Hourly Fuel Consumption section for definition).	Continuous operation at an average gross weight approaching recommended. Minimal overloading, good haul roads, moderate load factor. (See Hourly Fuel Consumption section for definition).	Continuous operation at or above maximum recommended gross weight. Overloading, poor haul roads, high load factor. (See Hourly Fuel Consumption section for definition). Note — Continual loading beyond recommended maximum gross weight will further reduce Zone C hours.
769D-777D	50,000 Hr	40,000 Hr	30,000 Hr
784C-797	60,000 Hr	50,000 Hr	40,000 Hr

*Insufficient data.

	ZONE A Moderate	ZONE B Average	ZONE C Severe
ARTICULATED TRUCKS	Earthmoving and stockpile use with well matched loading equipment. Short to medium hauls on well-maintained level haul roads. Free flowing material. Few impact loads.	Varying load and haul road conditions. High rolling resistance and poor traction during part of the job. Some adverse grades. Some impact loads. Typical use in road-building, dam construction, open-pit mining, etc.	Continuous use on very poorly maintained haul roads, high rolling resistance and poor traction. Frequent adverse grades and high impact loads. Poorly-matched loading equipment with continuous over-loading.
	15,000 Hr	10,000 Hr	8,000 Hr
WHEEL TRACTORS & COMPACTORS	Light utility work. Stockpile work. Pulling compactors. Dozing loose fill. No impact.	Production dozing, pushloading in clays, sands, silts, loose gravels. Shovel clean-up.	Production dozing in rock. Push-loading in rocky, bouldery borrow pits. High impact conditions. Landfill compactor work.
	15,000 Hr	12,000 Hr	8,000 Hr
WHEEL LOADERS	Intermittent truck loading from stockpile, hopper charging on firm, smooth surfaces. Free flowing, low density materials. Utility work in governmental and industrial applications. Light snowplowing. Load and carry on good surface for short distances with no grades.	Continuous truck loading from stockpile. Low to medium density materials in properly sized bucket. Hopper charging in low to medium rolling resistance. Loading from bank in good digging. Load and carry on poor surfaces and slight adverse grades.	Loading shot rock (large loaders). Handling high density materials with counterweighted machine. Steady loading from very tight banks. Continuous work on rough or very soft surfaces. Load and carry in hard digging; travel longer distances on poor surfaces with adverse grades.
902-908	*	*	*
914G-972G	12,000 Hr	10,000 Hr	8,000 Hr
980G-992G	15,000 Hr	12,000 Hr	10,000 Hr
994D	60,000 Hr	50,000 Hr	40,000 Hr
TRACK LOADERS	Site clearing of small vegitation, stripping top soil, carrying to stockpile. Intermittent truck loading from stockpile. Free flowing, low density materials with standard bucket. No impact. Backfilling and grading.	Bank excavation, intermittent ripping, basement digging of natural bed clays, sands, silts, gravels. Some traveling. Steady full throttle operation.	Loading shot rock, cobbles, glacial till, caliche. Steel mill work. High density materials in standard bucket. Continuous work on rock surfaces. Large amount of ripping of tight, rocky materials. High impact conditions.
933C-939C	8,000 Hr	6,000 Hr	Not Recommended
953C	10,000 Hr	8,000 Hr	6,000 Hr
963C-973C	12,000 Hr	10,000 Hr	8,000 Hr
INTEGRATED TOOLCARRIERS	Intermittent truck loading from stockpile, hopper charging on firm, smooth surfaces. Free flowing, low density materials. Utility work in governmental and industrial applications. Light snow-plowing. Load and carry on good surface for short distances with no grades.	Continuous truck loading from stockpile. Low to medium density materials in properly sized bucket. Hopper charging in low to medium rolling resistance. Loading from bank in good digging. Load and carry on poor surfaces and slight adverse grades.	Loading shot rock (large loaders). Handling high density materials with counterweighted machine. Steady loading from very tight banks. Continuous work on rough or very soft surfaces. Load and carry in hard digging; travel longer distances on poor surfaces with adverse grades.
	12,000 Hr	10,000 Hr	8,000 Hr

*Insufficient data.

	ZONE A Moderate	ZONE B Average	ZONE C Severe
UNDERGROUND ARTICULATED TRUCKS **AD40, AE40**	Continuous operation at <80% of maximum recommended gross weight. Short to medium haul distances: 300–1000 meters (990–3300 feet) Well-maintained, level haul roads. Very few tray impacts. Low load factor. 40,000 Hr	Intermittent operation at maximum recommended gross weight. Medium to longer haul distances: 1000–5000 meters (3300–16,000 ft) Varying haul road conditions and/or grades. Occasional tray impacts. Medium load factor. 30,000 Hr	Continuous operation at maximum recommended gross weight. Long haul distances: >5000 meters (>16,000 feet) Poor haul road conditions and/or steep grades. Frequent tray impacts. High load factor. 15,000 Hr
UNDERGROUND LOAD HAUL DUMP UNITS **R1300, R1600, R1700, R2900**	Dig and carry operation from stock piles to ground level transfer station. Low density, free flowing ore and waste. Excellent draw point floor surfaces. Short haul distances: 25–100 meters (80–330 feet) Level roads with good surface conditions. Low load factor. 25,000 Hr	Intermittent development/production loading into trucks/transfer station. Good digging with well shot, low to medium density ore and waste. Average draw point floor surfaces. Medium haul distances: 100–200 meters (330–660 feet) Poor road surfaces with slightly adverse grades. Medium load factor. 20,000 Hr	Continuous production loading of trucks at or near maximum load height. Difficult digging. Loading haul trucks. Rough draw point surfaces. Long haul distances: 200–300 meters (650–990 feet) Poor haul roads with adverse grades. High load factor. 15,000 Hr
UNDERGROUND RIGID TRUCKS **69D Dumper, 69D Ejector, 73D Dumper**	Continuous operation at <80% of maximum recommended gross weight. Short to medium haul distances: 300–1000 meters (990–3300 feet) Well-maintained, level haul roads. Very few tray impacts. Low load factor. 40,000 Hr	Intermittent operation at maximum recommended gross weight. Medium to longer haul distances: 1000–5000 meters (3300–16,000 ft) Varying haul road conditions and/or grades. Occasional tray impacts. Medium load factor. 30,000 Hr	Continuous operation at maximum recommended gross weight. Long haul distances: >5000 meters (>16,000 feet) Poor haul road conditions and/or steep grades. Frequent tray impacts. High load factor. 20,000 Hr

AGRICULTURAL TRACTOR DEPRECIATION AND REPAIR COSTS

Unlike construction tractors which often are depreciated over 10,000 hours, the expected useful life of a Caterpillar steel tracked tractor in agriculture can range up to and beyond 20,000 hours (about eighteen years). The Challenger Tractor Line expected life is about 10,000 hours.

The tractor's decline in value is always a significant portion of the machinery cost in farming. The actual market value of any tractor is determined by many variables ... machine age and condition, rate of change in size and farm operations in the area, popularity of given makes of tractors in the community, etc.

Whatever the variables, the decline in value is greater the first year than the second, greater the second year than the third, etc. The shorter the machine's work life, the higher the percentage of its value lost in a year.

Although the percentage of loss each year depends on the life of the machine, it's a general rule that 40 to 50% of the value will be lost in the first quarter of the machine's life. By the halfway point of lifetime, from 70 to 75% of value will be lost.

The sum of digits is a common, easily used method for predicting the farm tractor's depreciation value.

Assume a machine's total life is 18 years. Assign each of those years a value, beginning with 18 for the first year, 17 for the second, 16 for the third, etc. The sum of all 18 digits is 171 which when divided into the initial new machine value, will give a specific monetary figure. The first year, 18 units of value are written off, 17 the second year, etc.

The resale value loss for the first four-year's of machine life progresses as follows:

End of Year	Largest Remaining Digit	Loss of Value In Year	Loss of Value To Date	Remaining Value
1	18	18/171 or 10.5%	10.5%	89.5%
2	17	17/171 or 9.9%	(10.5 + 9.9) 20.4%	79.6%
3	16	16/171 or 9.3%	(20.4 + 9.3) 29.7%	70.3%
4	15	15/171 or 8.7%	(29.7 + 8.7) 38.4%	61.6%

Repairs — The reverse of the sum of digits formula can be used to predict repair costs for agricultural tractors.

Again, assuming an 18-year life, the sum of the digits would be 171. But the digit assigned the first year would be 1, the second year 2, etc.

NOTE: The digital method applied to depreciation yields an eventual 100% of the purchase price. The American Society of Agricultural Engineers recommends repair costs for crawler tractors be figured at 78% and wheel tractors at 120% of purchase price.

(1) DELIVERED PRICE

(Line Item 1a, b and c)

Delivered price should include all costs of putting a machine on the user's job including transportation and any applicable sales taxes.

On rubber tired machines, tires are considered a wear item and covered as an operating expense. Accordingly, some users may wish to deduct tire costs from the delivered price particularly for larger machines.

(2) RESIDUAL VALUE AT REPLACEMENT

(Line Item 2 and Subsection 2A)

Any piece of earthmoving machinery will have some residual value at trade-in. While many owners prefer to depreciate their equipment to zero value, others recognize the residual resale or trade-in value. This is at the estimator's option, but as in the discussion of depreciation, today's higher equipment costs almost dictate that resale value be considered in determining the net depreciable investment. And if machines are traded early for tax incentive purposes, resale value becomes even more significant.

For many owners, potential resale or trade-in value is a key factor in their purchasing decisions, since this is a means of reducing the investment they must recover through depreciation charges. The high resale value of Caterpillar built machines can reduce hourly depreciation charges, lower total hourly owning costs and improve the owner's competitive position.

When resale or trade-in value is used in estimating hourly owning and operating costs, local conditions must be considered, as used equipment values vary widely around the world. However, in any given used equipment business, factors which have greatest influence on resale or trade-in value are the number of hours on the machine at the time of sale or trade, the type of jobs and operating conditions in which it worked, and the physical condition of the machine. Your local Cat Dealer is your best source for determining current used equipment values.

Subsection 2A can be used to calculate the estimated residual value. If recent auction prices for used machines are used as a guide, then the value (or percentage) should be adjusted downward to remove the effect of inflation. Governmental indices on construction equipment costs or Dealer price records can be used to calculate the amount of inflation for the appropriate useful life. Another way to estimate residual value is comparing the current used machine value to the current new machine price provided major product changes haven't occurred.

3 VALUE TO BE RECOVERED THROUGH WORK

(Line Item 3a and b)

The delivered price less the estimated residual value results in the value to be recovered through work, divided by the total usage hours, gives the hourly cost to protect the asset's value.

4 INTEREST

(Line Item 4)

Many owners charge interest as part of hourly owning and operating costs, others consider it as general overhead in their overall operation. When charged to specific machines, interest is usually based on the owner's average annual investment in the unit.

Interest is considered to be the cost of using capital. The interest on capital used to purchase a machine must be considered, whether the machine is purchased outright or financed.

If the machine will be used for N years (where N is the number of years of use), calculate the average annual investment during the use period and apply the interest rate and expected annual usage:

$$\frac{\left[\frac{N+1}{2N} \times \text{Delivered Price}\right] \times \text{Simple Interest \% rate}}{\text{hours/year}}$$

5-6 INSURANCE AND TAXES

(Line Items 5 and 6)

Insurance cost and property taxes can be calculated in one of two ways. If the specific annual cost is known this figure should be multiplied by the estimated usage (hours/years) and used. However, when the specific interest and tax costs for each machine are not known, the following formulas can be applied:

$$\frac{\text{Insurance}}{\text{N = No. Years}}$$

$$\frac{\left[\frac{N+1}{2N} \times \text{Delivered Price}\right] \times \text{Insurance rate \%}}{\text{hours/year}}$$

$$\frac{\text{Property Tax}}{\text{N = No. Years}}$$

$$\frac{\left[\frac{N+1}{2N} \times \text{Delivered Price}\right] \times \text{Tax rate \%}}{\text{hours/year}}$$

8-13 ESTIMATING OPERATING COSTS

(Line Items 8 through 13)

8 FUEL CONSUMPTION

(Line Item 8)

Fuel consumption can be closely measured in the field. However, if no opportunity exists to do this, consumption can be predicted when the machine application is known.

Application determines engine load factor which in turn controls engine fuel consumption. An engine continuously producing full rated horsepower is operating at a load factor of 1.0. Earthmoving machines may reach a 1.0 load factor intermittently, but seldom operate at this level for extended periods of time. Periods spent at idle, dozer and pusher travel in reverse, haul units traveling empty, close maneuvering at part throttle and operating downhill are examples of conditions which reduce load factor.

The following tables provide hourly fuel consumption estimates at various load factors for Caterpillar built machines. Since machine uses vary, application guides are also provided to aid in estimating load factor.

To estimate hourly fuel cost, select the load factor based on application and find hourly consumption. Then:

Hourly consumption × Local Unit Price of Fuel = Hourly Fuel Cost

When using these tables, keep in mind the many variables which can affect fuel consumption. Two operators of different temperament or attitude operating identical machines side by side in the same material can have as much as 10-12% difference in their consumption rates. However, the ranges shown should be applicable across a wide spectrum of conditions. Your Caterpillar dealer representative can help select the most reasonable estimate for your specific situation; we suggest you call on him.

Keep in mind also that a fuel consumption study measured over a short period of operation will give higher fuel consumption than shown here because: (1) the study will be at 100% efficiency, without breaks or idle time, and (2) the operators will know they're "under the gun" to produce and look good. On the other hand, these tables allow for "normal" inefficiencies in the working cycle and will more closely relate to "normal" day to day operation.

LOAD FACTOR GUIDE

High: Steady ripping, shuttle pushloading and downhill dozing. Agricultural drawbar work at full throttle, engine lugged to max. power most of the time. Little or no idling or travel in reverse.

Medium: Production dozing, pulling scrapers, most pushloading. Agricultural drawbar work at full throttle but not always lugging engine. Some idling and some travel with no load.

Low: Considerable idling or travel with no load.

LOAD FACTOR GUIDE

High: Most pipeline applications in hard rocky material. Digging 90-95% of the daily work schedule.
Medium: Most residential sewer applications in natural bed clay. Digging 60-85% of the daily work schedule. Most log loading applications.
Low: Most utility, urban applications in sandy loam. Digging less than 50% of the daily work schedule. Scrap handling applications.

FRONT SHOVELS

Model	Low		Medium		High	
	liter	U.S. gal	liter	U.S. gal	liter	U.S. gal

LOAD FACTOR GUIDE — 525

High: Skidding loads over 6800 kg (15,000 lb) in steep terrain (over 10%) with high skidding resistance.
Medium: Skidding loads up to 6800 kg (15,000 lb) in moderate terrain (5-10%) with average skidding resistance.
Low: Skidding loads less than 4500 kg (10,000 lb) in flat terrain (0-5%) with low skidding resistance.

LOAD FACTOR GUIDE — 517

High: Skidding loads over 4536 kg (10,000 lb) in steep terrain (over 30%) with high skidding resistance.
Medium: Skidding loads up to 4536 kg (10,000 lb) in moderate terrain (8-30%) with medium skidding resistance.
Low: Skidding loads less than 4536 kg (10,000 lb) in flat terrain (0-8%) with low skidding resistance.

LOAD FACTOR GUIDE — 527

High: Skidding loads over 6360 kg (14,000 lb) in steep terrain (over 30%) with high skidding resistance.
Medium: Skidding loads up to 6360 kg (14,000 lb) in moderate terrain (8-30%) with medium skidding resistance.
Low: Skidding loads less than 6360 kg (14,000 lb) in flat terrain (0-8%) with low skidding resistance.

LOAD FACTOR GUIDE

High: Long haul time with frequent adverse grades. Continuous use on very poorly maintained haul roads with high rolling resistance.

Medium: Normal load and haul time. Varying load and haul road conditions. Some adverse grades. Some high rolling resistance.

Low: Large amount of idling. Short to medium hauls on well maintained level haul roads. Minimum total resistance.

LOAD FACTOR GUIDE

Note: The above table lists general fuel rates (i.e. fuel burned per hour) based on the following load factors. Machine utilization and job efficiency should be used in conjunction with these load factors to properly evaluate fuel consumption. However, fuel efficiency (i.e. tons of material moved per unit of fuel burned) is the best indicator of the impact of fuel consumption on owning and operating costs.

High: Continuous and aggressive tight truck loading, hard bank excavation, and shot rock loading from a face.

Medium: Maximum productivity in aggregate truck loading and hopper charging. Assumes the normal tramming and load & carry associated with the high productivity stockpile load-out and batch plant applications.

Low: Light utility, construction, low production aggregate truck loading, and most logging applications where there is considerable idling, empty travel, and load & carry.

9 LUBE OILS, FILTERS, GREASE

(Line Item 9 and Subsection 9A)

Hourly costs of lube oils and grease can be approximately estimated by taking consumptions from the table below and applying local prices.

See the page following these tables for instructions on how to estimate local hourly filter costs.

NOTE: These figures are based upon machines operating in ideal conditions without *loss* of lubricants. They were computed by dividing recommended change intervals (in hours) into tank capacity. Make-up quantities are *not* included in these computations.

APPROXIMATE HOURLY CONSUMPTION OF LUBRICANTS

(When operating in heavy dust, deep mud or water, increase the quantities by 25%.)

*Total number of lubricant changes (crankcase, transmission, final drives and hydraulic) over a 2000 hour period (500 for 834G & 836G). Total may vary depending upon the sulfur content of your diesel fuel. Always consult your machine's Lube and Maintenance Guide.

**The number shown here refers to the total number of grease fittings you can expect to service over a 2000 hour period. Total can vary depending upon how your machine is equipped.

***Insufficient data.

****Included with hydrostatic drive.

†Includes differential (Wheel Loaders, Integrated Toolcarriers and Articulated Trucks).

GUIDE FOR ESTIMATING LOCAL HOURLY COST OF FILTERS

The approximate hourly filter costs were determined by using the following formula:

Filters	Change Interval*	#Filters	Cost**	#Filters/ 2000 hr.	Total Cost
Engine	250 hr.	_____	$_____	_____	$_____
Transmission	500	_____	_____	_____	_____
Hydraulic	500	_____	_____	_____	_____
Fuel — primary	2000	_____	_____	_____	_____
— final	500	_____	_____	_____	_____
Air — primary	2000	_____	_____	_____	_____
— secondary	1000	_____	_____	_____	_____

Total Filter Cost/2000 hr. = $_____

Total Cost $_____ ÷ 2000 hr. = $_____ Hourly Filter Cost.

*Recommended change interval may vary with machine and sulfur content of diesel fuel. Always consult Lube & Maintenance Guide.

**Cost of filter is suggested consumer list price. For the small excavators and the 613C, we assumed an average of $6.50 per filter.

NOTE: The approximate hourly filter costs do *not* include labor. To determine your labor cost you can apply your hourly labor rate to 5 minutes per each filter change. For example, if your labor rate is $50.00 per hour then your labor cost for one filter change would be $4.17.

GUIDE FOR ESTIMATING LOCAL HOURLY COST OF FILTERS

The approximate hourly filter costs were determined by using the following formula:

Filters	Interval*	Change #Filters	Cost**	#Filters/ 2000 hr.	Total Cost
Engine	250 hr.	_____	$_____	_____	$_____
Transmission	500	_____	_____	_____	_____
Hydraulic	500	_____	_____	_____	_____
Fuel — primary	2000	_____	_____	_____	_____
— final	500	_____	_____	_____	_____
Air — primary	2000	_____	_____	_____	_____
— secondary	1000	_____	_____	_____	_____

Total Filter Cost/2000 hr. = $_____

Total Cost $_____ ÷ 2000 hr. = $_____ Hourly Filter Cost.

*Recommended change interval may vary with machine and sulfur content of diesel fuel. Always consult Lube & Maintenance Guide.
**Cost of filter is suggested consumer list price.

NOTE: The approximate hourly filter costs do *not* include labor. To determine your labor cost you can apply your hourly labor rate to 5 minutes per each filter change. For example, if your labor rate is $50.00 per hour then your labor cost for one filter change would be $4.17.

10a TIRES

(Line Item 10a)

Tire costs are an important part of the hourly cost of any wheel machine. The best estimate of this item is obtained when tire life figures based on experience are used with prices the machine owner actually pays for the replacement tires.

For cases in which tire experience is not available, use the following tire life estimator curves.

Tire Life Estimators

- Curves do not allow for additional life from recapping. They assume new tires run to destruction, but this is not necessarily recommended.
- Based on standard machine tires. Optional tires will shift these curves either up or down.
- Sudden failure (blow out) due to exceeding Ton-MPH (tkm/h) limitations is not considered. Nor are premature failures due to puncture.
- Application Zones:

  Zone A: almost all tires actually wear through the tread from abrasion.

  Zone B: tires wear out normally but others fail prematurely due to rock cuts, impacts and non-repairable punctures.

  Zone C: few, if any, tires wear through the tread due to non-repairable damages, usually from rock cuts, impacts and continuous overloading.

NOTE: Tire life can often be increased by using extra tread and extra deep tread tires.

NOTE: Premature failure could occur at any time due to puncture.

GOODYEAR LIFE ESTIMATING SYSTEM

As an additional assist in estimating *hauling unit* tire life, Goodyear Tire and Rubber Co. has furnished the following information which is included here with their permission. READ THE PREAMBLE CAREFULLY.

"… at present, there is no completely accurate, fool-proof method of forecasting tire life. Tire engineers have many theoretical methods … but these generally are so involved and time consuming that they are impractical for field use.

"However, the tire industry has made many surveys of tire performance and arrived at a system which can give rough *estimates* of tire life. Studies done by the major tire companies and by at least two major equipment manufacturers are in close agreement.

"The table [which follows] shows how to apply this system …"

ESTIMATED TIRE SERVICE LIFE OF HAULING UNITS (Trucks & Scrapers)

No.	Condition	Factor
I	**Maintenance**	
	Excellent	1.090
	Average	0.981
	Poor	0.763
II	**Speeds (Maximum)**	
	10 mph ~ 16 km/h	1.090
	20 mph ~ 32 km/h	0.872
	30 mph ~ 48 km/h	0.763
III	**Surface Conditions**	
	Soft Earth — No Rock	1.090
	Soft Earth — Some Rock	0.981
	Well Maintained — Gravel Road	0.981
	Poorly Maintained — Gravel Road	0.763
	Blasted — Sharp Rock	0.654
IV	**Wheel Positions**	
	Trailing	1.090
	Front	0.981
	Driver (Rear Dump)	0.872
	(Bottom Dump)	0.763
	(Self Propelled Scraper)	0.654
V	**Loads** (See No. VIII note)	
	T&RA/ETRTO* Recommended Loading	1.090
	20% Overload	0.872
	40% Overload	0.545
VI	**Curves**	
	None	1.090
	Medium	0.981
	Severe	0.872
VII	**Grades** (Drive Tires Only)	
	Level	1.090
	5% Max.	0.981
	15% Max.	0.763
VIII	**Other Miscellaneous Combinations** (See note below)	
	None	1.090
	Medium	0.981
	Severe	0.872
	Condition VIII is to be used when overloading is present in combination with one or more of the primary conditions of maintenance, speeds, surface conditions and curves. The combination of severe levels in these conditions, together with an overload, will create a new and more serious condition which will contribute to early tire failure to a larger extent than will the individual factors of each condition.	

*Tire and Rim Association/European Tire and Rim Technical Organization.

Type of Tire	Base Average Life		
	Hours	Miles	km
E-3 Std. Bias Tread	2510	25,100	40 400
E-4 Bias Xtra Tread	3510	35,100	56 500
E-4 Radial Xtra Tread	4200	42,000	67 600

Using Base Hours (or Miles), multiply by the appropriate factor for *each* condition to obtain approximate estimated hours (or miles) as the final product.

Example: An off-highway truck equipped with E-4 drive tires running on a well maintained haul road having easy curves and minimum grades and receiving "average" tire maintenance attention but being 20% overloaded:

Condition: I II III IV V VI VII VIII

Factor: $0.981 \times 0.872 \times 0.981 \times 0.872 \times 0.872 \times 0.981 \times 0.981 \times 0.981 \times 3510$ base hours = 2114 hours (say 2100 hours)

As can be seen, this system requires the careful application of strictly subjective judgments, and can be expected to result in conservative estimates. Keep in mind, however, **that the system is offered only as an aid in estimating and not as a rigid set of rules.**

On the other hand, if tire life on a given job is considered less than satisfactory, an analysis of these factors may point to conditions which can be improved to the betterment of tire life.

Replacement tire prices should always be obtained from local tire company sources.

Since tires are considered a wear item in this method of estimating owning and operating costs, total tire replacement cost is deducted from machine delivered price to arrive at a net figure for depreciation purposes. Outlay for tires is then included as an item in operating costs:

$$\text{Hourly Tire Cost} = \frac{\text{Replacement Cost of Tires}}{\text{Estimating Tire Life in Hours}}$$

Recapping can sometimes lower hourly tire cost. Considerations are availability of molds, local recapping costs, and experience with recap life.

10b UNDERCARRIAGE

(Line Item 10b)

Undercarriage expense can be a major portion of the operating costs for track-type machines, and these costs can vary *independently* of basic machine costs. That is, the undercarriage can be employed in an extremely abrasive, high-wear environment while the basic machine may be in an essentially easy application, and vice-versa. For that reason, it is recommended that the hourly cost of undercarriage be calculated separately as a wear item rather than being included in the repair reserve for the basic machine. Notice that the repair reserves (Line Item 11) DO NOT include provision for undercarriage replacement.

Three primary conditions affect probable life-expectancy of track-type undercarriage:

1. **Impact.** The most measurable effect of impact is structural — that is bending, chipping, cracking, spalling, roll-over, etc., and problems with hardware and pin and bushing retention.

   Impact ratings:

   High — Non-penetrable hard surfaces with 150 mm (6") or higher bumps.

   Moderate — Partially penetrable surfaces and bumps of 75-150 mm (3-6") height.

   Low — Completely penetrable surfaces (which provide full shoe plate support) with few bumps.

2. **Abrasiveness.** The tendency of the underfoot materials to grind away the wear surfaces of track components.

   Abrasiveness ratings:

   High — Saturated wet soils containing a high proportion of hard, angular or sharp sand or rock particles.

   Moderate — Slightly or intermittently damp soils containing a low proportion of hard, angular or sharp particles.

   Low — Dry soils or rock containing a low proportion of hard, angular or sharp sand or rock chip particles.

   Impact and abrasiveness in combination can accelerate wear rates beyond their individual effects when considered alone, thus further reducing component life. This should be taken into account in determining impact and abrasiveness ratings or, if preferred, the combination can be included in selecting the "Z" factor.

3. **"Z" factor.** Represents the combined effect on component life of the many intangible environmental, operational and maintenance considerations on a given job.

   Environment and Terrain. Earth which may not be abrasive itself can pack in sprocket teeth, causing interference and high stress as the teeth engage the bushings. Corrosive chemicals in the materials being moved or in the natural soil can affect wear rates, while moisture and temperature can exaggerate the effect. Temperature alone can play its own role — hot slag and hard-frozen soils being but the extremes. Constant sidehill work can increase wear on the sides of components.

Operation. Some operator practices tend to increase track wear and cost if not controlled on the job. Such practices include high-speed operation, particularly in reverse; tight turns or constant corrections in direction; and stalling the tractor under load forcing the tracks to slip.

Maintenance. Good maintenance — proper track tension, daily cleaning when working in sticky materials, etc. — combined with periodic wear measurement and timely attention to recommended services (CTS) can extend component life and lower costs by minimizing the effects of these and other adverse conditions.

While impact and abrasion should not be too difficult to judge, selection of the proper "Z" factor will require careful analysis of job conditions such as weather, tendency for soil packing, side-hill loading, corrosive environment, etc.; operational factors such as high-speed reverse, amount of travel, tight turns, track slippage under overload, etc.; and maintenance considerations such as proper tensioning, use of Custom Track Service, etc.

Selection of the "Z" multiplier is strictly a matter of judgement and common sense, but its effect on cost can be the difference between profit on a controlled job and heavy loss where control is allowed to slip. To assist in arriving at an appropriate value for the "Z" factor, consider that proper maintenance — or the lack thereof — will represent about 50% of its effect, environment and terrain 30%, and operator practices 20%. For large excavators the amount of travel is the critical part of the "Z" factor. A good operator working under good field conditions can be counterbalanced by poor maintenance practices to yield a fairly high "Z" factor. On the other hand, close attention to maintenance, tension and alignment can more than offset a bad underfoot condition resulting in severe sprocket packing, and lead to selection of a moderate to low "Z" factor. Obviously, flexibility in selection of a "Z" factor has been built into the system, and use of this flexibility is encouraged. Further, a considerable measure of control can be maintained over the "Z" factor, and any reduction of its effects is money in the bank. Your Caterpillar Dealer CTS man can be invaluable in this endeavor as well as helping you establish a comprehensive undercarriage cost control program.

Estimating Undercarriage Cost

The guide below gives a basic factor for the various track-type machines and a series of conditions multipliers to modify the basic cost according to the anticipated impact, abrasive and miscellaneous ("Z") conditions under which the unit will be operating.

Step 1. Select machine and its corresponding basic factor.

Step 2. Determine range for impact, abrasiveness and "Z" conditions.

Step 3. *Add* selected conditions multipliers and apply sum to basic factor.

The result will be the estimated hourly cost for undercarriage in that application.

Undercarriage Basic Factors

Model	Basic Factor
5230	19.0
D11R	17.0
5130B	15.0
D10R	12.5
D9R	10.0
D8R	8.5
973, 589, D7R LGP	9.0
D7R, 963C, 583R, D6R LGP, D7R XR	8.0
375, 5080	6.4
D6R, 953C, 572R, D6M LGP, D6R XL, D6R XR	6.2
365B	6.1
345B Series II	5.3
D5M LGP, D6 SR, D6M XL, 517, 527	5.0
330B	4.4
D3C (All), D4C (All), D5C (All), 933 (All), 939, 561M	3.7
325B	3.4
315B, 317B, 318B L, 322B	3.0
D4 SR, 320C	2.5
307B, 311B, 312B	2.2

Conditions Multipliers

	Impact	Abrasiveness	"Z"
High	0.3	0.4	1.0
Moderate	0.2	0.2	0.5
Low	0.1	0.1	0.2

Example: D10R in high impact, non-abrasive material with a moderate "Z" factor.

D10R Basic Factor = 12.5
Multipliers: I = 0.3
A = 0.1
Z = 0.5

Hourly undercarriage cost = 12.5 (0.3 + 0.1 + 0.5) = **$11.25/hour**

NOTE: 1. Conditions Multipliers may be selected in any combination. Thus, a multiplier of 0.4 (all low-range multipliers) represents the best of the best, while 1.7 (all high range multipliers) would be the worst of the worst conditions.

2. The hourly undercarriage cost estimate resulting from this method will be made up of *approximately* 70% parts cost and 30% labor charges. The cost of undercarriage components is based on published U.S. Consumers List Prices and may be adjusted as needed for import duties, exchange rates, etc. outside the United States. Labor has been figured at $50.00 (U.S.) per shop hour.

3. For further information and guidance, refer to the current issue of the Caterpillar Custom Track Service Handbook.

4. This formula for estimating undercarriage cost should not be used for tractors working in stockpile coal handling applications. Undercarriage costs are nominal in stockpile coal handling, and using this formula will result in estimating cost substantially above actual costs.

11 REPAIR RESERVE

(Line Item 11)

Repairs are normally the largest single item in operating costs and include all parts and direct labor (except operator's wages) chargeable to the machine. Shop overhead can be absorbed in general overhead or charged to machines as a percent of direct labor cost, whichever is the owner's normal practice.

Hourly repair costs for a single machine normally follow an upward stairstep pattern since major outlays for repairs usually come in spurts. However, when broad averages are considered, the stairstep becomes a smooth, upward curve. Since this hourly repair cost curve starts low and gradually rises over time, hourly operating costs must be adjusted upward as the unit ages. Alternatively an average repair cost can be used which provides a straight line graph. Most owners prefer the average method, and it is the one suggested here.

Since repair costs are low initially and rise gradually, averaging them produces extra funds at first which are reserved to cover future higher costs.

Machine applications, operating conditions and maintenance attention determine repair costs. In any specific application, actual cost experience on similar work provides the best basis for establishing the hourly repair reserve. When local records are inadequate or not available, the hourly repair reserve charts following this discussion may be used. Turn for a moment to these charts and examine their general format.

These average costs are taken from a variety of applications and every attempt was made to assure accuracy. Recognize that any one application may vary considerably from these averages. They are only marginally useful in predicting costs since few jobs are 'average'. The use of these averages would be especially questioned when special attachments such as rippers are used, and when a machine is moving from job to job. For these reasons, we suggest the use of these averages for comparative purposes and gross estimates only. Your Caterpillar dealer has the ability to make more accurate repair cost estimates and we suggest you use his experience and expertise if you need help in estimating operating costs.

Applying these basic factors and multipliers will result in the average hourly cost over the entire period. This should produce an excess in the early hours (or a "sinking fund") to cover normal increases in actual repair costs as the machine ages.

The cost applies to the machine as described in each individual chart, but does not cover the following:

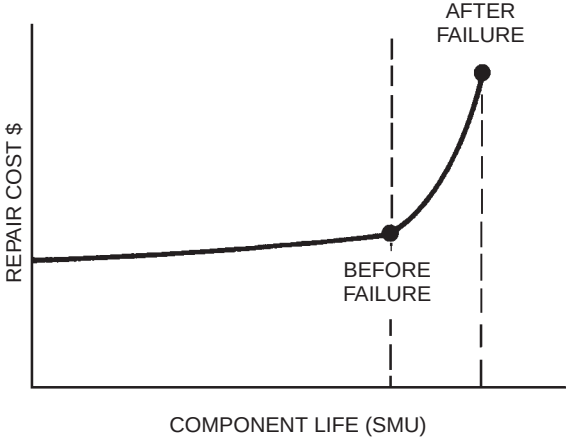
- Dozer blade (although hydraulics are included)
- Bucket (although hydraulics are included)
- Ground engaging tools
- Undercarriage
- Tires, Chopper Blades or Tamping Feet Assemblies and Rims

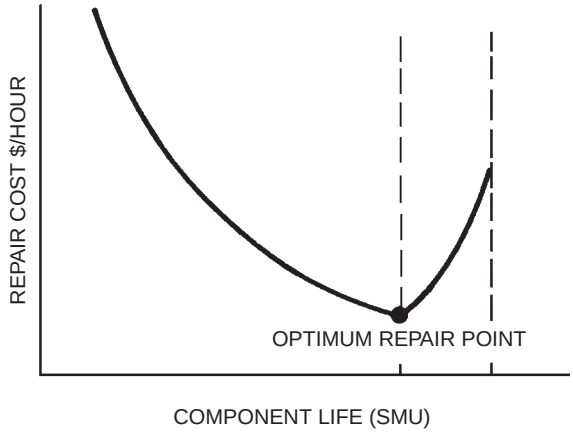
- Labor for daily and periodic maintenance
- Material/supply items for daily and periodic maintenance
- Fuel, oil and grease
- Service truck mileage costs
- Serviceman's travel costs
- Machine transportation to and from shop
- Cost of performing Technical Analysis or Scheduled Oil Sampling
- Operator
- Risk or insurance
- Parts and labor price escalation
- Attachments

The basic repair factors are based on the first 10,000 hours of service, parts at published U.S. Consumers List Prices, and labor at a total selling price of $60.00 (U.S.) per hour. Extended use multipliers are given for those cases where a machine is to be used beyond 10,000 hours; the adjusted cost-per hour will apply to the *entire* use period, not just the additional hours. For applications outside the United States where import duties and other expenses have a large effect on parts prices, and for other areas where labor charges (remember to include shop and tool overhead in addition to mechanic's wages!) differ greatly from the $60.00 base, an approximate breakdown of the total factor by percentages for parts and labor also are given. This breakdown should permit easy adjustment to local conditions.

As stated, repair costs are affected by application, operation, maintenance, and age of the equipment. The most significant effects on cost will be those factors affecting major component life. A second significant factor is whether the repair is performed before or after catastrophic failure. Repair before a major component fails can be one-third of an after failure repair with only a moderate sacrifice in life (see graphs). Repairing a major component just prior to failure achieves optimum cost per hour. Oil analysis and other diagnostic tools, maintenance inspections and indicators, and operator notes are vital to determine the optimum repair point and thereby achieving lower hourly repair costs. Maintenance practices are significant because they affect component longevity and the percentage of scheduled, before failure repairs.

Another important factor in using repair reserve estimates is the Service Meter Unit (SMU) or hour basis. The cost estimate should be flexed depending on the machine's duty cycle. Fuel consumption is often a good indicator of duty cycle, and this factor may override the application zone. All of these factors are significant in estimating repair costs. Weigh them carefully prior to using the repair reserve tables.





INSTRUCTIONS — To estimate hourly repair costs, enter the chart for the machine in question and determine the basic factor for the applicable job conditions. Operating conditions zones for each bar are:

These generally conform to the definitions given earlier in the section on depreciation. If the unit is to be used more than 10,000 hours, apply the Extended-life Multiplier for that period.

Example:

1 — A 988F Wheel Loader loading well-shot rock on a hard, level quarry floor will be used for seven years or about 15,000 hours.

Basic Repair Factor = 9.50
Extended-life Multiplier = 1.10
Estimated Repair Cost = 9.50 × 1.10 =
$10.45/Hour

2 — A D6R is used about 1600 hours per year on general utility and clean-up work for a contractor who does not baby his equipment, but does insist on careful operation, and has an excellent preventive maintenance program. He intends to trade at the end of five years. He can be considered to be at the lower end of the "normal" or B zone, if not slightly less.

Basic Repair Factor = 5.00
Total Use:
5 years @ 1600 hr/yr = **8000** hours
Extended-use Multiplier = 1.0
Estimated Repair Cost = 5.00 × 1.0 =
$5.00/Hour

Repair Reserve charts follow …►

TRACK-TYPE TRACTORS

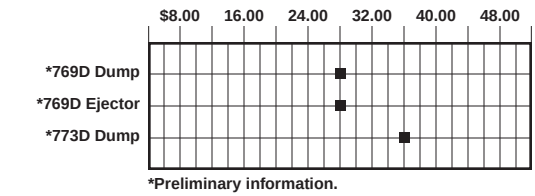
Includes basic truck equipped with standard underground dump body or standard underground ejector body.



*Preliminary information.

(12) SPECIAL WEAR ITEMS

(Line Item 12 and Subsection 12A)

All costs for high-wear items such as cutting edges, ripper tips, bucket teeth, body liners, router bits, etc., and welding costs on booms and sticks should be included here. These costs will vary widely depending on applications, materials and operating techniques. Consult your Caterpillar Dealer Parts Department for estimated life under your job conditions.

(15) OPERATOR'S HOURLY WAGE

(Line Item 15)

This item should be based on local wage scales and should include the hourly cost of fringe benefits.

EXAMPLES OF FIGURING OWNING AND OPERATING COSTS

Example I: ESTIMATING HOURLY OWNING AND OPERATING COSTS OF A TRACK-TYPE TRACTOR

Assume a power shift track-type tractor with straight bulldozer, hydraulic control, tilt cylinder and three-shank ripper, is purchased by a contractor for $135,000, delivered price at job site.

Application will be production dozing of bank gravel. Minimal ripping will be required to loosen material.

In the following calculations, refer as necessary to the source material already reviewed.

OWNING COSTS —

To Determine Residual Value at Replacement

Enter delivered price, $135,000, in space (A). (See example form at end of this discussion.) Since the machine being considered is a track-type tractor, no tires are involved. This particular owner's experience is that at trade-in time, the tractor will be worth approximately 35% of its original value. This $47,250 trade-in value is entered in space (B) leaving a net of $87,750 to be recovered through work.

Enter the value to be recovered through work in space (C).

Indicated ownership period is 7 years with annual usage of 1200 hours per year or 8400 hours of total ownership usage.

Divide the Net Value from space (C), $87,750, by Ownership Usage, 8400 hours, and enter result $10.45 in space (D).

Interest, Insurance, Taxes

In this example, local rates are assumed as follows:

Interest	16%
Insurance	1%
Taxes	1%
	18%

Using the following formula:

N = 7:

$$\frac{\left[\frac{7+1}{2\times 7}\times \$135{,}000\right]\times 0.16}{1200} = \$10.29$$

Enter $10.29 in space (E).

Insurance and property taxes can also be calculated using the same formula as shown for the interest cost, and entering them on lines 5 and 6.

Items 3b, 4, 5 and 6 can now be added and the result, $22.02 entered in space (H) Total Hourly Owning Costs.

OPERATING COSTS —

Fuel

See fuel consumption tables. The intended application, production dozing, indicates a medium load factor. Assume that the estimated fuel consumption from the table is 18.1 liter/hr (4.8 U.S. gal/hr.). Cost of fuel in this locality is $0.34/liter ($1.25/U.S. gal.).

Consumption		Unit Cost		Total
18 liter/hr	×	$0.34 liter	=	$6.12
5 gal/hr	×	$1.25 gal.	=	$6.25

Enter this figure in space (I).

Lube Oils, Filters, Grease

For these items, you can use the lubricants consumption tables and the filter cost calculator for a detailed estimate. Assume the table shows an approximate hourly cost for lube oils, filters and grease (materials and labor) for this tractor of $0.46. Enter this figure in space (J).

Tires

Since this example considers a track-type tractor, space (K) is left blank.

Undercarriage

Our estimating reference gives an undercarriage cost Basic Factor of 6.2 for this tractor. It is anticipated that with some ripping on the job, impact loading of track components will be medium, indicating an "I" multiplier of 0.2. The gravel-sand mix in the bank, being dry, should be only moderately abrasive for an "A" multiplier of 0.2. In analyzing the miscellaneous conditions: there is enough clay in the bank to produce some packing of the sprockets; the operator is careful, but is forced into some tight turns because of space limitations; there is good drainage in the pit; track tension is checked weekly; and all track-type equipment on the job is enrolled in the Custom Track Service program. Accordingly, the "Z" multiplier is judged to be somewhat greater than low level — 0.3 in this case.

It should be noted that in applying particularly the "Z" factor, rather wide flexibility is provided and was used in the above example. Such flexibility is intended and its use encouraged.

Then:

Cost per hour = Basic Factor × (I + A + Z)
Basic Factor = 6.2
Conditions Multipliers: I = 0.2
A = 0.2
Z = 0.3
Cost per hour 6.2 (0.2 + 0.2 + 0.3) = $4.34 which is entered in space (L).

Repairs

In determining the depreciation period, we established the intended use of the machine as a Zone B application. The Repair Reserve graph for track-type tractors indicates that the mid-range for our tractor is approximately 4.50 on the basis of 10,000 hours of use. The tractor is to be used over 8400 hours, so the Extended-life Multiplier in this case is 1.0.

Therefore, Repair Reserve = 1.0 × 4.50 = $4.50 per hour, which is entered in space (M).

Special Items

Assuming the tractor is equipped with a three-shank ripper and an "S" dozer, allowance must be made for ripper tips, shank protectors, and dozer cutting edges.

Assume your knowledge of the operation indicates the ripper will be used only about 20% of total tractor operating time. Estimated tip life while in use is 30 hours. Therefore, tips will be replaced:

$$\frac{30 \text{ Hours}}{0.20} = \text{each 150 hours of tractor operation}$$

Shank protector life is estimated at three times tip life or 450 hours of tractor operation. In this medium duty application, no shank replacement is expected in the 8400 hour depreciation period of the tractor.

Cutting edge life is estimated to be 500 hours.

Using local prices for these items, hourly costs are estimated as follows:

$$\text{Tips: } \frac{3 \text{ @ } \$35.00 \text{ ea.}}{150 \text{ hr.}} = \$0.70 \text{ per hour}$$

$$\text{Shank Protectors: } \frac{3 \text{ @ } \$55.00 \text{ ea.}}{450 \text{ hr.}} = \$0.37 \text{ per hour}$$

$$\text{Cutting Edges: } \frac{\$125 \text{ per set}}{500 \text{ hr.}} = \$0.25 \text{ per hour}$$

The total of these, $1.32; is entered in space (N).

Items 8, 9, 10b, 11 and 12 can now be added and the result, $15.63, is entered in space (O), Total Hourly Operating Costs.

Operator's Hourly Wage

Assume this is $20.00 including fringe benefits. This figure is entered in space (P).

Total Owning Costs, Total Operating Costs and Operator's Hourly Wage are now added together and the result, $57.65, is entered in space (Q). The itemized estimate of Hourly Owning and Operating Costs is now complete.

Example II: ESTIMATING HOURLY OWNING AND OPERATING COSTS OF A WHEELED VEHICLE

With only a few simple changes, owning and operating costs for a wheeled vehicle are calculated using the same format as that used for the Track-Type Tractor. Only the differences will be explained as we look at example calculations for a wheel loader.

OWNING COSTS —

To Determine Residual Value at Replacement

Enter delivered price in space (A). The cost of tires is deducted since they will be treated as a wear item. For purposes of illustration, the Wheel Loader is estimated to have a potential 48% trade-in value (B) at the end of the 5 year/7500 hour ownership usage, leaving a net value to be recovered through work of $34,320 (C).

Interest, Insurance, Taxes

Refer to the formulas using the same rates as before and 1500 operating hours per year. The factor 4.22 is applied to the interest cost (E).

Insurance and property taxes can also be calculated using the same formula as shown for the interest cost.

The sum of lines 3b, 4, 5 and 6 gives the total hourly owning cost, line 7.

OPERATING COSTS —

Fuel

See the fuel consumption tables and apply the actual cost of purchasing fuel in the project area (I).

Lube Oils, Filters, Etc.

Use either the item-by-item worksheet or the summary tables. Enter the total item in space (J) on line 9.

Tires

Use the tire replacement cost and the best estimate of tire life based on experience and anticipated job conditions.

Repairs

Find the applicable basic repair factor for Zone B application from the bar charts (4.00). Again, the use period for the Wheel Loader is 7500 hours, so the Extended-life Multiplier is 1.0.

Therefore, Repair Reserve = 1.0 × 4.00 = $4.00 per hour.

Special Items

Ground engaging tools, welding, etc. are covered here. Use current costs for cutting edges and similar items. Use your best estimate of the hours of life which can be expected from them based on previous experience in like materials. Enter the total on line 12.

The total of lines 8 through 13 represents hourly operating costs.

Operator's Hourly Wage

To give a true picture of operator cost, include fringe benefits as well as direct hourly wages (line 15).

TOTAL O&O

The total of lines 7, 13 and 15 is the total hourly owning and operating cost of the machine. Keep in mind that this is an estimate and can change radically from project to project. For the greatest accuracy, the hourly cost reflected in actual on-the-job cost records should be used.

REPAIR RESERVE CONVERSION FACTORS (line 11)

For use in countries outside the United States where parts and service costs might differ from those used in charts and tables:

Labor Rate Ratio (1) _____ (2) _____
Parts Cost Ratio (1) _____ (2) _____

QUICK ESTIMATOR HOURLY OWNING AND OPERATING COSTS

NOTE: Hourly Owning and Operating Costs for a given model of machinery vary widely because they are influenced by many factors: the type of work the machine does, local prices for fuel and lubricants, shipping costs from the factory, interest rates, operator's wages, tire or track life, rock versus earth, hours per year, etc. Use the following figures as QUICK GUIDELINES ONLY. When precise owning & operating cost estimates are required, calculate them using the format on the preceding pages and your particular conditions.

Quick estimator figures shown are based on the following assumptions:

- List prices f.o.b. factory.
- Machines equipped as indicated (certain attachments included may not be normal in some areas).
- Ownership period: Guide for selecting ownership period based on application and operating conditions.
- The basic repair factors are based on the first 10,000 hours of service.
- Parts at published U.S. Consumers List Prices.
- Labor for repairs at a total selling price of $50.00 (U.S.) per hour.
- MODERATE: Zone A, or moderate job conditions. Typical U.S.A. Auction Results for the machine used in computing resale and depreciation.
- AVERAGE: Zone B, or average job conditions. Typical U.S.A. Auction Results for the machine used in computing resale and depreciation.
- SEVERE: Zone C, or severe job conditions. Typical U.S.A. Auction Results for the machine used in computing resale and depreciation and is adjusted for machine condition.
- Lubricants and hydraulic oil at $6.35 per U.S. Gal. plus labor.
- Grease at $0.71 per fitting (includes labor).
- Filters at U.S. Consumer's List Prices plus labor.
- Fuel at $1.25 per U.S. Gal.
- Figures include average tire costs at 50% list price.
- ALL FIGURES EXCLUDE INTEREST, INSURANCE, TAXES AND OPERATOR (due to wide variance around the world).

Track-Type Tractors *Example equipment:* straight bulldozer with tilt cylinder, hydraulic control, ROPS canopy, crankcase and track roller guards, front pull hook, light system, and vandalism protection.

	O&O/hr.		
	Moderate	**Average**	**Severe**
D3C Series III	$ 9.00	$ 14.00	$ 22.00

TIRES

CONTENTS

SELECTION, APPLICATION, MAINTENANCE

Proper tire selection, application and maintenance continue to be the most important factors in earthmoving economics. Wheel tractors, loaders, scrapers, trucks, motor graders, etc. are earthmoving equipment whose productivity and payload unit cost may depend more on tire performance than any other factor.

Off-the-road tires must operate under a wide variety of conditions ranging from dry "potato dirt" through wet severe shot rock. Speed conditions vary from less than 1 mph average to 72 kmh (45 mph). Gradients may vary from 75% favorable to 30% adverse. Climatic conditions, operator skills, maintenance practices, etc. all may have a profound effect on tire life and unit costs.

Although one specific tire construction may be acceptable in a variety of applications, no one tire can meet all requirements on any one machine and perhaps not even one job. The many differences in tire requirements on earthmoving machines have resulted in a wide variety of tread and carcass designs being made available. The optimum tire selection for a specific machine on a given job should be a joint decision between the user and tire supplier. Several tire manufacturers have technical and application representatives in the field for proper guidance in tire selection.

When job conditions change, it may be desirable to select a different tire configuration to meet the new requirements.

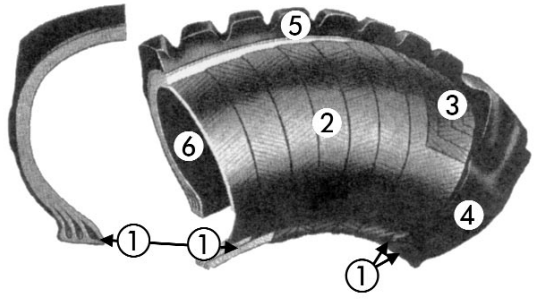
TIRE CONSTRUCTION

The pneumatic tire is essentially a flexible pressure vessel utilizing structural members (nylon, steel cable, etc.) to contain the hoop tension resulting from the inflation pressure. Rubber is utilized as a protective coating and sealant over the structural members and makes up the tread pattern which provides the wearing medium at the ground interface. The following brief explanation of the various tire constructions will assist you in selecting tires for your specific application.

Two distinct tire constructions approved on all Caterpillar machines are the BIAS PLY and RADIAL PLY tires. The following is a brief explanation of the principal features of these two constructions.

Bias Ply

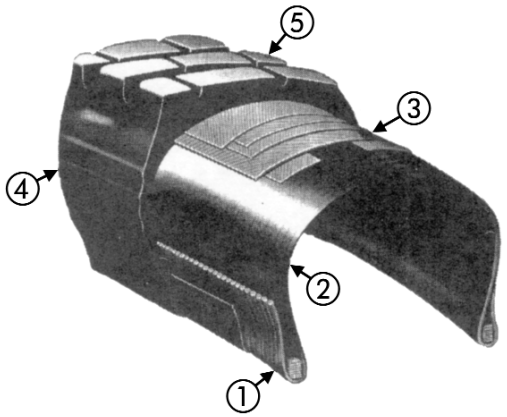
1. *Beads* — The tire beads consist of steel wire-bundles (3 or 4 in larger tires) which are forced laterally by tire inflation pressure to wedge the tire firmly on the rim's tapered bead seat. The nylon plies tie into the bead bundles. The forces inherent in the tire are transmitted from the rim through the bead bundles into the nylon.
2. *Body plies* — Layers of rubber-cushioned nylon cord comprise the tire carcass. Alternating plies of cord cross the tread centerline at an angle (bias). The term "ply rating" is an index of tire strength and not the actual number of tire plies.



Bias Ply Construction

3. *Breakers or tread plies* — These, if used, are confined to the tire's tread area and are intended to improve carcass strength and provide additional protection to the body plies. Some "work" tires employ steel breakers or belts to further protect the carcass.
4. Sidewalls — These are the protective rubber layers covering the body plies in the sidewall.
5. *Tread* — The wearing part of the tire which contacts the ground. It transmits the machine weight to the ground and provides traction and flotation.
6. *Inner liner* — This is the sealing medium which retains the air and, combined with the "O" ring seal and rim base, eliminates the need for inner tubes and flaps.
7. *Tubes and flaps (not shown)* — Required if the tire is not of tubeless construction with an inner liner.
8. *Undertread* — Protective rubber cushion lying between tread and body ply.

Radial Ply



Radial Ply Construction

1. *Beads* — A single bead bundle of steel cables or steel strip (spiraled like a clock spring) comprise the bead at each rim interface.
2. *Radial carcass* — This consists of a single layer or ply of steel cables laid archwise (on the radian) bead to bead.
3. *Belts* — Several layers or plies of steel cable form the belts which underlie the tread area around the tire circumference. The cable in each belt crosses the tread centerline at an angle with the angle being reversed from the preceding belt.
4. *Sidewalls.*
5. *Tread.*
6. *Undertread* — Protective rubber cushion lying between tread and steel belts.

TIRE TYPES

Off-the-road tires are classified by application in one of the following three categories:

1. *Transport tire* — For earthmoving machines that transport material such as trucks and wheel tractors.
2. *Work tire* — Normally applied to slow moving earthmoving machines such as graders and loaders.
3. *Load and carry* — Wheel loaders engaged in transporting as well as digging.

TIRE SIZE NOMENCLATURE

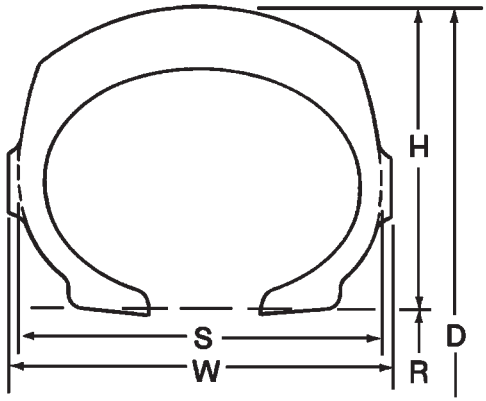
Tire size nomenclature is derived from the approximate cross section width and rim diameter with various systems being available:

1. A wide base tire, for example, is designated as a 29.5-35 with the approximate cross section width being the first number (inches) and the rim diameter the second number (inches). Industry standards permit this tire's width to be a maximum of 824 mm (32.45") in service.
2. A standard base tire, for example, is designated as a 24.00-35 with the approximate cross section width being the first number (inches) and the rim diameter the second number (inches). Industry standards permit this tire width to be a maximum 718 mm (28.27") in service.
3. A low profile tire, for example, is designated as a 40/65-39 (formerly 65/40-39 or 40-39) with the approximate cross section width being the first (40) number (inches) and the rim diameter the third (39) number (inches). The second number (65 actually is 0.65) is the aspect ratio (section height divided by section width).

   If designated 40/65 R39, then the R denotes radial construction.

The wide base tire has an aspect ratio of approximately 0.83 and the standard base 0.95. The "low profile tire" has an aspect ratio of 0.65.

When comparing a wide base tire to a standard base tire, it must be remembered a larger first number on a wide base tire with the same rim diameter does not mean the wide base is larger in overall diameter. For example, the 18.00-25 standard base tire is larger in diameter than the 20.5-25 wide base. It is comparable in overall diameter to the 23.5-25 wide base.



Tire cross-section

D = Tire Overall Diameter
R = Nominal Rim Diameter
H = Tire Section Height
S = Tire Section Width
W = Tire Width (includes ornamental ribs)
$\frac{H}{S}$ = Aspect Ratio

CODE IDENTIFICATION FOR OFF-HIGHWAY TIRES

The tire industry has adopted a code identification system to be used for off-the-road tires. This identification system will reduce the confusion caused by the trade names for each type of tire offered by each tire manufacturer. The industry code identification is divided into six main categories by types of service as follows:

C — Compactor Service
E — Earthmover Service
G — Grader Service
L — Loader & Dozer Service
LS — Log-Skidder Service
ML — Mining & Logging Service

The sub-categories are designated by numerals, as follows:

Code Identification

		% Tread Depth
Compactor		
C-1	Smooth	100
C-2	Grooved	100
Earthmover		
E-1	Rib	100
E-2	Traction	100
E-3	Rock	100
E-4	Rock Deep Tread	150
E-7	Flotation	80
Grader		
G-1	Rib	100
G-2	Traction	100
G-3	Rock	100
G-4	Rock Deep Tread	150
Loader & Dozer		
L-2	Traction	100
L-3	Rock	100
L-4	Rock Deep Tread	150
L-5	Rock Extra Deep Tread	250
L-3S	Smooth	100
L-4S	Smooth Deep Tread	150
L-5S	Smooth Extra Deep Tread	250
L-5/L-5S	Half Tread Extra Deep	250
Mining & Logging		
ML-1	Rib	100
ML-2	Traction	100
ML-3	Rock	100
ML-4	Rock Deep Tread	150
Log-Skidders		
LS-1	Regular Tread	100
LS-2	Intermediate Tread	125
LS-3	Deep Tread	150
HF-4	Extra Deep Tread	250

NOTE: On some Michelin tires the designation R or T may follow the TRA code to designate rock or traction type tire.

Tire and Rim Assoc. Code	Tread Type	FIRESTONE	CONTINENTAL GENERAL	GOODYEAR	BRIDGESTONE	MICHELIN

RADIAL TIRE IDENTIFICATION

Code Identification for Michelin Tires

All Michelin earthmover tires are radial construction, designated by the "X" marking. They contain a single steel radial ply with a series of steel belts placed around the tire's circumference which reinforce and stabilize the tread.

Following are the tread designs currently available from Michelin with the different internal constructions depending on the application.

Type A4 Highly resistant to cutting, hacking and abrasion.

Type A Highly resistant to cutting, hacking and abrasion for use at average speeds higher than type A4.

Type B4 A compromise between resistance to abrasion and heat generation for less aggressive surfaces (from 49").

Type B Designed for low heat generation on long runs and in intensive service conditions.

Type C4 Engineered to cope with high-speed travel on long hauls.

Type C Specially designed to cope with the highest-speed hauls.

The current combinations of tread patterns, construction, and tread depths offered, and primary TRA codes are:

Tread Design	Type A4	Type A	Type B	Type C	Primary TRA Codes

Since Michelin radial tires contain a single steel casing ply, they utilize the industry method of designating radial tire strength in terms of "stars." Their system consists of a one star, two star, and three star rating as an indication of the tire's carrying capacity. The one star is the lightest construction, generally used on work and slow moving transport machines. Two star tires are used on most medium and high speed transport machines. Three star construction provides the greatest carrying capacity for a given size and is only available in small standard base tires.

This combination of tread designs and types of construction provides a range of radial tires which cover most earthmoving applications. We recommend that in applying steel radial tires to your machines you provide all site condition data to the tire manufacturer. Obtain his recommendations as to which tire will provide the most economical operation.

Code Identification for Goodyear Radial Tires

All Goodyear steel radial earthmover tires have been designated *Unisteel* followed by a three or four digit alpha-numeric code that identifies the particular tread. The currently active codes are:

RL-2+	E 2/3 and L 2/3		
RL-2F	E2 and L2	RL-4H/HII	E4
RL-3	E3	RL-4J	E4
RL-3+	E3	RL-4JII	E4
RL-3J	E3 and L3	GP-2B	E3
RT-3A	E3		
RL-4	E4		L3
RL-4A	E4	SG-2B	G2
RL-4B	E4	RL-4K	L4
GP-4B	E4	GP-4B	L4
GP-4D	E4	RL-5K	L5

The RL stands for Rock Lug and indicates that the upper sidewall has rock protection. The number in the code corresponds to the tire industry identification system (2-traction, 3-rock, etc). The fourth digit, if any, is used to designate tread design differences for the same basic tread type (F-directional tread).

The carcass strength is indicated by a star rating system instead of the ply rating system. These symbols indicate the recommended inflation for a particular tire load.

Following the star rating code is Goodyear's Custom Compound and Construction code. For a tire designated "2S" the 2 indicates a heat resistant compound and the S indicates standard construction and an H indicates heavy duty construction. The higher the number the greater the abrasion and cut resistance with a corresponding lower T-km/h (TON-mph) rating.

Code Identification for Bridgestone Radial Tires

The Bridgestone steel radial earthmover has been designated as V-Steel. The current nomenclature is:

V-Steel Ultra Traction	(VUT)	G2/L2
V-Steel K-Traction	(VKT)	E2/L2/G2
V-Steel F-Traction	(VFT)	E2
V-Steel L-Traction	(VLT)	E3/L3
V-Steel M-Traction	(VMT)	E3/L3
V-Steel G-Traction	(VGT)	E2
V-Steel M-Traction S	(VMTS)	E4
V-Steel R-Lug	(VRL)	E3
V-Steel R-Lug S	(VRLS)	E4
V-Steel A-Lug S	(VALS)	E4/L4
V-Steel H-Block	(VHB)	E2
V-Steel E-Lug	(VEL)	E3
V-Steel E-Lug S	(VELS)	E4
V-Steel D-Lug	(VSDL)	L5
V-Steel Smooth Tread MS	(VSMS)	L5S
V-Steel Snow Wedge	(VSW)	L2/G2
V-Steel Container Handler	(VCH)	L4
V-Steel Jamal	(VSJ)	E7
V-Steel Z-Traction S	(VZTS)	E4
V-Steel M-Traction Premium	(VMTP)	E4
V-Steel L-Traction S	(VLTS)	E4
V-Steel N-Traction	(VSNT)	L4
V-Steel D-Traction	(VSDT)	L5

Bridgestone has multiple tread compounds, with the three most commonly used being: type 1A = standard, type 2A = cut resistant and type 3A = heat resistant. The carcass strength, i.e., load carrying capacity of tire is indicated by star rating system; 1-star, 2-star and 3-star. All Bridgestone radial tires conform to the international tire standard of TRA and ETRTO.

TON-MILES PER HOUR

Tire selection and machine operating practices have, in some cases, become the critical factors in the over-all success of earthmoving ventures. One of the most serious problems occur when tires are operated at temperatures above their capabilities. Separation and related failures occur. To help you avoid temperature related failures, Caterpillar has been instrumental in developing the *Ton-Miles Per Hour*, (Ton-MPH) method of rating tires.

Heat and Tire Failure

Tire manufacturing requires heat in the vulcanizing process converting crude rubber and additives into a homogeneous compound. The heat required is typically above 132°C (270°F).

A tire also generates heat as it rolls and flexes. Heat generated faster than it can be radiated into the atmosphere gradually builds within the tire and reaches maximum level at the outermost ply or belt.

Over time, enough heat can develop from overflexing to actually reverse the vulcanizing process or "revert" the rubber causing ply separation and tire failure. Only a brief time at reversion temperature initiates the failure. Experience shows that few pure heat separation cases occur. Most so-called heat separations are in tires operating below the reversion level.

As a tire's operating temperature increases the rubber and textiles within significantly lose strength. The tire becomes more susceptible to failures from cornering, braking, impact, cut through, fatigue and heat separation. If operating tires at higher temperatures is absolutely necessary, it is essential the machines be operated to reduce the probability of premature tire failure. No hard cornering without superelevation, no panic braking, etc.

The Ton-MPH formula was developed to predict tire temperature buildup. The system is a method of rating tires in proportion to the amount of work they can do from a temperature standpoint. It utilizes the product of *load* × *speed* to derive an index of the tire temperature buildup. Maximum tire level-off temperatures of 107°C (225°F) for fabric cord tires and 93°C (200°F) for steel wire tires are the limits Caterpillar recommends. Even at these temperatures, failures may be initiated by overstressing the tires.

It is possible by using a needle type pyrometer to measure temperature at any desired point within the tire carcass. However, the instrumentation and the technique does not lend itself to general field use. The greatest difficulty is locating the thickest (therefore the hottest) tread bar in any given tire using giant calipers. The tire must then be drilled along the centerline of this bar from shoulder to shoulder at 52 mm (2") intervals. These 3.18 mm (1/8") diameter holes extend down through the tread and undertread to the topmost reinforcement. This procedure is fully described under SAE Recommended practice J1015.

The Ton-MPH rating system as given in this SAE specification is approved by most tire manufacturers. Michelin, in addition to providing Ton-MPH ratings has developed their own speed/load carrying rating system and we recommend that Michelin be consulted where high tire temperatures are a concern.

Heat generation in a specific tire at recommended pressure depends on three factors:

- the weight the tire is carrying (flex per revolution),
- the speed the tire is traveling over the ground (flexures over a period of time), and
- the air temperature surrounding the tire (ambient temperature) and road surface temperature.

Once a tire manufacturer has determined a tire's temperature characteristics and expressed them in Ton-MPH, the above listed specific job conditions can be used to determine any tire's maximum work capacity. These conditions provide on site ability to predict and avoid costly tire separations.

Ton-Mile-Per-Hour Rating System

The tire TMPH can be matched to the site TMPH as well as compared with TMPH values of different makes and types of tires.

TMPH Job Rate

Average Tire Load × Average Speed for the shift

Average Tire Load

$$\frac{\text{“Empty” tire load + “loaded” tire load}}{2}$$

Average Speed

$$\frac{\text{Round trip distance in miles} \times \text{number of trips}}{\text{Total Hours (in the shift)}}$$

For excessive haul length (20 miles or more) consult your tire representative for modification to the TMPH value.

To use in the metric system, change miles to kilometers and use metric tons.

It should be noted that prolonged operation at high carcass temperatures can fatigue the nylon at the flex points in the sidewalls.

The following are the most recent Ton-MPH ratings as made available by Goodyear, Michelin and Bridgestone, and are subject to change on their part at any time. Other tire manufacturers' Ton-MPH ratings will be included in future handbook editions when and if made available. For latest Ton-MPH ratings, consult specific tire manufacturer at time of machine and/or tire purchase.

Load-and-Carry T-km/h (Ton-MPH)

The wheel loader, when used in load-and-carry applications, may encounter temperature problems similar to those normally associated only with tires on scrapers, trucks and wagons. **Do not place the vehicle in load-and-carry applications without first consulting the tire manufacturer, or obtaining T-km/h (Ton-MPH) ratings and pressure recommendations from the tire manufacturer.**

Conventional and Radial Steel Cord Tire Options

Tire options now provide types to operate in conditions ranging from rock and abrasive materials, to jobs with high speed hauls in good materials.

The best tire type can be different for the drive tires than for other tires on the same machine. T-km/h (Ton-MPH) should be calculated for all tires.

Tire Drive-Away Recommendations

Heat separation can be a problem during machine delivery and moving machines from one job to another. Whenever roading earthmoving machines, *check your supplier for the tire manufacturer's recommended speed limitations on the specific tires involved.*

Some tire manufacturers also recommend that vehicles equipped with extra tread depth or special compounded tires should not be roaded without their specific approval. Our tests support this recommendation, especially for L-3, L-4, E-4 and L-5 tires.

T-km/h (Ton-MPH) RATINGS
AT 38° C (100° F) AMBIENT TEMPERATURE
For Haul Lengths of 32 km (20 Miles) or Less One Way

Because of the variance between specific tires it is recommended that at the time of purchase you check with your tire supplier for the manufacturer's specific T-km/h (Ton-MPH) ratings for the tires purchased.

TIRE AND RIM ASSOCIATION RATINGS

While the T-km/h (Ton-MPH) Rating System provides a method to determine the tire's work capacity, Tire and Rim Association Ratings provide a guide for evaluating a tire's structural capacity. These two rating systems should be used in conjunction to evaluate tire performance.

TIRE SELECTION

Selecting the optimum tire for a given application is particularly critical for earthmoving. The machines have the capability to outperform the tires and, unless proper practices are observed, very costly premature tire failures can occur. Job conditions vary greatly throughout the world, as well as within any given job site, and selecting the optimum tire requires careful consideration of all factors involved. In general, the tire manufacturer should be consulted before making the selection for any given application. In some cases, the tire manufacturer can fabricate tires specifically tailored for a given job site.

For those applications where wear is extremely slow, especially as a result of only occasional operation throughout the year, the cheapest lightweight tire needs to be given strong consideration.

As job conditions become severe, the following factors should be evaluated in selecting a tire:

Transport or Load-and-carry —

- T-km/h (Ton-MPH) (primary consideration)
- Minimum approved ply rating or greater
- Largest optional size
- Thickest tread commensurate with T-km/h (Ton-MPH)
- Largest practical bar to gap ratio
- Most cut resistant tread commensurate with T-km/h (Ton-MPH)
- Belted construction

Grader —

- Tire load rating suitable for maximum equipped machine weight (See Tire Load Worksheet)
- Application specific tire (snow, construction, road maintenance, mining, general purpose, all season)
- Bias or radial based on initial cost, puncture resistance, rolling resistance, life to retread/repair

Tire Load Worksheet (Motor Graders)

A. Total machine operating weight:
Base operating weight 1a _____
Attachments #1 _____
#2 _____
#3 _____
Sum of #1-3) 2a _____
Total machine operating weight
Sum of 1a. & 2a.) 3a _____

B. Load on rear of machine
(.7) x (3a.) = 1b.

C. Load per tandem tire
(1b.) / 4 = 1c.

D. Load on front of machine
.3 x (3a.) = 1d.

E. Load per front tire
(1d.) / 2 = 1e.

F. Controlling tire load
the greater of 1c. or 1e. 1f.

G. Tire load rating 1g.

Tire acceptability check:
Tire load < tire load rating
1f. < 1g.

Loader or Dozer —

- Minimum approved ply rating or greater
- Largest optional size
- Thickest tread
- Thickest available undertread
- Buttressed shoulder
- Most cut resistant tread
- Largest practical bar to gap ratio
- Belted construction
- Lowest aspect ratio

All tires should be operated at the tire manufacturer's recommended inflation pressure for a given application. Inflation pressure should be checked every working day with an accurate Bourden-tube type gauge. This gauge should be checked against a known standard such as a dead weight tester at least once a month.

Excess loads may result from factors such as varying material density, field modifications to equipment, mud accumulation, load transfer, etc. Only under these conditions may the actual in service tire load exceed the rated machine load. When excess loads are encountered, cold inflation pressures **must** be increased to compensate for higher loads. Increase tire inflation pressure 2% for each 1% increase in load.

	Maximum Excess Load	Pressure
Bias Ply	15%	30%
Radial Ply	7%	14%

The above loads will result in reduced tire performance and must be approved by the tire manufacturer.

The use of chains is difficult to justify except under a few conditions. Chains are very costly and heavy, and require more maintenance than most operations can provide. On some models sufficient clearance does not exist for chains with all tire combinations. Extensive modifications may be required if chains are needed for the job.

Foam filling tires is normally not recommended due to high cost and lack of local filling facilities. Its use should be confined to loader and dozer applications where penetrations occur almost daily. If foam is used be sure to adhere to recommended equivalent pressures of nitrogen and use highest available ply rating. Consult tire manufacturer for specific warranty concerns.

TIRE SELECTION GUIDE

Material	Road or ground condition	Treads	
		Wheel Tractor-Scrapers	Wheel Tractors or Wheel Loaders
Silt and clay, No Rock, High moisture content.	Good varying to poor. High rolling resistance.	Traction Type (E-2).	Traction Type (L-2).
Silt and Clay, Some rock, Variable moisture content.	Good varying to poor.	Rock-type (E-3) best unless traction is a problem — then use traction tires (E-2). Rock-type offers more resistance to cutting.	Rock-type (L-3, L-4 or L-5) best unless traction is a problem — then use traction (L-2) tires. Rock-type offers more resistance to cutting.
Silty or clayey gravel and sand, Low moisture content.	Excellent to good. Firm surface.	Rock-type (E-3) offers better wear.	Rock-type (L-3, L-4 or L-5) offers better wear.
Silty or clayey gravel and sand, High moisture content.	Poor, rutted, pot holes.	Rock-type (E-3).	Rock-type (L-3, L-4 or L-5).
Blasted rock.	Hard surface, rough.	Rock-type (E-3 or L-3 and L-4 if possible).	Rock-type (L-5 or L-5S).
Sand Very low silt or clay content.	Good to fair surface.	Rock-type (E-3 or L-3S and L-4S if possible) with low pressure. Creates minimum soil disturbance resulting improved flotation.	Rock-type (L-3 or L-3S) with low pressure. Creates minimum soil disturbance resulting in improved flotation.

TIRE SUPPLIER RECOMMENDED COLD INFLATION PRESSURES

The following tables present Caterpillar and the *tire suppliers'* recommended cold inflation pressures for tires on Caterpillar machines. An asterisk (*) indicates the standard tire size and ply rating.

The inflation pressure is based on a ready-to-work vehicle weight with no attachments, rated payload, and average operating conditions. **Pressures for each application may need to be varied from those shown and should always be obtained from your tire supplier.**

Pressures for all tires apply to rib, traction, rock, deep tread, and super deep tread tires.

NOTE: Caterpillar now recommends using dry nitrogen (N_2) gas for both tire inflation and pressure adjustments on all current and past production machines.

EXCAVATORS — Bias Ply

For complete tire data and inflation pressures, see the Excavator section in this handbook.

*Ballast weight for bias ply tires from Goodyear data, radial ply weights from Michelin data. Contact your tire supplier for additional information. Under abnormal tire wear conditions, ballasting of rear tires may be desirable. Ballasting of front tires also should only be done where extremely rapid tire wear rates are encountered. Excessive weight will reduce machine performance.

**Fillage beyond 75% of tire enclosed volume is not recommended. With liquid ballasting, inflation pressure must be checked at least once per day.

***1.6 kg **(3½ lb)** Calcium Chloride per gallon water. Solution weighs 4.6 kg **(10.15 lb)** per gallon.

NOTE: When liquid ballasting telehandler tires, consult Telehandler's Operation and Maintenance Manual for requirements. Total machine mass including all attachments in operating condition, all reservoirs at full capacity and ballasted tires must not exceed certification mass listed on the ROPS certification label.

MINING AND EARTHMOVING

CONTENTS

INTRODUCTION

This section explains the earthmoving principles used to determine machine productivity. It shows how to calculate production on-the-job or estimate production off-the-job.

Machine performance is usually measured on an hourly basis in terms of machine productivity and machine owning and operating cost. Optimum machine performance can be expressed as follows:

$$\text{Lowest cost per ton} = \frac{\text{Lowest Possible Hourly Costs}}{\text{Highest Possible Hourly Productivity}}$$

ELEMENTS OF PRODUCTION

Production is the hourly rate at which material is moved. Production can be expressed in various units:

Metric

- Bank Cubic Meters — BCM — bank m^3
- Loose Cubic Meters — LCM — loose m^3
- Compacted Cubic Meters — CCM — compacted m^3
- Tonnes

English

- Bank Cubic Yards — BCY — bank yd^3
- Loose Cubic Yards — LCY — loose yd^3
- Compacted Cubic Yards — CCY — compacted yd^3
- Tons

For most earthmoving and material handling applications, production is calculated by multiplying the quantity of material (load) moved per cycle by the number of cycles per hour.

Production = Load/cycle × cycles/hour

The load can be determined by

1) load weighing
2) load estimating based on machine rating
3) surveyed volume divided by load count

Generally, earthmoving and overburden removal for coal mines are calculated by volume (bank cubic meters or bank cubic yards). Metal mines and aggregate producers usually work in weight (tons or tonnes).

Volume Measure — Material volume is defined according to its state in the earthmoving process. The three measures of volume are:

BCM (BCY) — one cubic meter (yard) of material as it lies in the natural bank state.

LCM (LCY) — one cubic meter (yard) of material which has been disturbed and has swelled as a result of movement.

CCM (CCY) — one cubic meter (yard) of material which has been compacted and has become more dense as a result of compaction.

In order to estimate production, the relationships between bank measure, loose measure, and compacted measure must be known.

Swell — Swell is the percentage of original volume (cubic meters or cubic yards) that a material increases when it is removed from the natural state. When excavated, the material breaks up into different size particles that do not fit together, causing air pockets or voids to reduce the weight per volume. For example to hold the same weight of one cubic unit of bank material it takes 30% more volume (1.3 times) after excavation. (Swell is 30%.)

$$1 + \text{Swell} = \frac{\text{Loose cubic volume for a given weight}}{\text{Bank cubic volume for the same given weight}}$$

$$\text{Bank} = \frac{\text{Loose}}{(1 + \text{Swell})}$$

$$\text{Loose} = \text{Bank} \times (1 + \text{Swell})$$

Example Problem:

If a material swells 20%, how many loose cubic meters (loose cubic yards) will it take to move 1000 bank cubic meters (1308 bank cubic yards)?

Loose = Bank × (1 + Swell) =
1000 BCM × (1 + .2) = 1200 LCM
1308 BCY × (1 + .2) = 1570 LCY

How many bank cubic meters (yards) were moved if a total of 1000 loose cubic meters (1308 yards) have been moved? Swell is 25%.

Bank = Loose ÷ (1 + Swell) =
1000 LCM ÷ (1 + .25) = 800 BCM
1308 LCY ÷ (1 + .25) = 1046 BCY

Load Factor — Assume one bank cubic yard of material weighs 3000 lb. Because of material characteristics, this bank cubic yard swells 30% to 1.3 loose cubic yards when loaded, with no change in weight. If this 1.0 bank cubic yard or 1.3 loose cubic yards is compacted, its volume may be reduced to 0.8 compacted cubic yard, and the weight is still 3000 lbs.

Instead of dividing by 1 + Swell to determine bank volume, the loose volume can be multiplied by the load factor.

If the percent of material swell is known, the load factor (L.F.) may be obtained by using the following relationship:

$$\text{L.F.} = \frac{100\%}{100\% + \%\ \text{swell}}$$

Load factors for various materials are listed in the Tables Section of this handbook.

To estimate the machine payload in bank cubic yards, the volume in loose cubic yards is multiplied by the load factor:

$$\text{Load (BCY)} = \text{Load (LCY)} \times \text{L.F.}$$

The ratio between compacted measure and bank measure is called shrinkage factor (S.F.):

$$\text{S.F.} = \frac{\text{Compacted cubic yards (CCY)}}{\text{Bank cubic yards (BCY)}}$$

Shrinkage factor is either estimated or obtained from job plans or specifications which show the conversion from compacted measure to bank measure. Shrinkage factor should not be confused with percentage compaction (used for specifying embankment density, such as Modified Proctor or CBR).

Material Density — Density is the weight per unit volume of a material. Materials have various densities depending on particle size, moisture content and variations in the material. The denser the material the more weight there is per unit of equal volume. Density estimates are provided in the Tables Section of this handbook.

$$\text{Density} = \frac{\text{Weight}}{\text{Volume}} = \frac{\text{kg (lbs)}}{\text{m}^3\,(\text{yd}^3)}$$

$$\text{Weight} = \text{Volume} \times \text{Density}$$

A given material's density changes between bank and loose. One cubic unit of loose material has less weight than one cubic unit of bank material due to air pockets and voids. To correct between bank and loose use the following equations.

$$1 + \text{Swell} = \frac{\text{kg/BCM}}{\text{kg/LCM}} \text{ or } \frac{\text{lbs/BCY}}{\text{lbs/LCY}}$$

$$\text{lbs/LCY} = \frac{\text{lb/BCY}}{(1 + \text{Swell})}$$

$$\text{lbs/BCY} = \text{lbs/LCY} \times (1 + \text{Swell})$$

Fill Factor — The percentage of an available volume in a body, bucket, or bowl that is actually used is expressed as the fill factor. A fill factor of 87% for a hauler body means that 13% of the rated volume is not being used to carry material. Buckets often have fill factors over 100%.

Example Problem:

A 14 cubic yard (heaped 2:1) bucket has a 105% fill factor when operating in a shot sandstone (4125 lbs/BCY and a 35% swell).

a) What is the loose density of the material?
b) What is the usable volume of the bucket?
c) What is the bucket payload per pass in BCY?
d) What is the bucket payload per pass in tons?

a) lb/LCY = lb/BCY ÷ (1 + Swell) = 4125 ÷ (1.35) = 3056 lb/LCY
b) LCY = rated LCY × fill factor = 14 × 1.05 = 14.7 LCY
c) lbs/pass = volume × density lb/LCY = 14.7 × 3056 = 44,923 lbs
   BCY/pass = weight ÷ density lb/BCY = 44,923 ÷ 4125 = 10.9 BCY
   or bucket LCY from part b ÷ (1 + Swell) = 14.7 ÷ 1.35 = 10.9 BCY
d) tons/pass = lbs ÷ 2000 lbs/ton = 44,923 ÷ 2000 = 22.5 tons

Example Problem:

Construct a 10,000 compacted cubic yard (CCY) bridge approach of dry clay with a shrinkage factor (S.F.) of 0.80. Haul unit is rated 14 loose cubic yards struck and 20 loose cubic yards heaped.

a) How many bank yards are needed?
b) How many loads are required?

a) $\text{BCY} = \frac{\text{CCY}}{\text{S.F.}} = \frac{10{,}000}{0.80} = 12{,}500 \text{ BCY}$

b) Load (BCY) = Capacity (LCY) × Load factor (L.F.) = 20 × 0.81
= 16.2 BCY/Load

(L.F. of 0.81 from Tables)

$$\text{Number of loads required} = \frac{12{,}500 \text{ BCY}}{16.2 \text{ BCY/Load}} = 772 \text{ Loads}$$

● ● ●

Soil Density Tests — There are a number of acceptable methods that can be used to determine soil density. Some that are currently in use are:

Nuclear density moisture gauge
Sand cone method
Oil method
Balloon method
Cylinder method

All these except the nuclear method use the following procedure:

1. Remove a soil sample from bank state.
2. Determine the volume of the hole.
3. Weigh the soil sample.
4. Calculate the density kg/BCM (lb/BCY).

The nuclear density moisture gauge is one of the most modern instruments for measuring soil density and moisture. A common radiation channel emits either neutrons or gamma rays into the soil. In determining soil density, the number of gamma rays absorbed and back scattered by soil particles is *indirectly* proportional to the soil density. When measuring moisture content, the number of moderated neutrons reflected back to the detector after colliding with hydrogen particles in the soil is *directly* proportional to the soil's moisture content.

All these methods are satisfactory and will provide accurate densities when performed correctly. Several repetitions are necessary to obtain an average.

FIGURING PRODUCTION ON-THE-JOB

Load Weighing — The most accurate method of determining the actual load carried is by weighing. This is normally done by weighing the haul unit one wheel or axle at a time with portable scales. Any scales of adequate capacity and accuracy can be used. While weighing, the machine should be relatively level to reduce error caused by weight transfer. Enough loads should be weighed to provide a good average. Machine weight is the sum of the individual wheel or axle weights.

The weight of the load can be determined using the empty and loaded weight of the unit.

Weight of
load = Gross machine weight – empty weight

To determine the bank cubic measure carried by a machine, the load weight is divided by the bank-state density of the material being hauled.

$$\text{BCY} = \frac{\text{Weight of load}}{\text{Bank density}}$$

Times Studies — To estimate production, the number of complete trips a unit makes per hour must be determined. First obtain the unit's cycle time with the help of a stop watch. Time several complete cycles to arrive at an average cycle time. By allowing the watch to run continuously, different segments such as load time, wait time, etc. can be recorded for each cycle. Knowing the individual time segments affords a good opportunity to evaluate the balance of the spread and job efficiency. The following is an example of a scraper load time study form. Numbers in the white columns are stop watch readings; numbers in the shaded columns are calculated:

Total Cycle Times (less delays)	Arrive Cut	Wait Time	Begin Load	Load Time	End Load	Begin Delay	Delay Time	End Delay
	0.00	0.30	0.30	0.60	0.90			
3.50	3.50	0.30	3.80	0.65	4.45			
4.00	7.50	0.35	7.85	0.70	8.55	9.95	1.00	10.95
4.00	12.50	0.42	12.92	0.68	13.60			

NOTE: All numbers are in minutes

This may be easily extended to include other segments of the cycle such as haul time, dump time, etc. Similar forms can be made for pushers, loaders, dozers, etc. *Wait Time* is the time a unit must wait for another unit so that the two can function together (haul unit waiting for pusher). *Delay Time* is any time, other than wait time, when a machine is not performing in the work cycle (scraper waiting to cross railroad track).

To determine trips-per-hour at 100% efficiency, divide 60 minutes by the average cycle time less all wait and delay time. Cycle time may or may not include wait and/or delay time. Therefore, it is possible to figure different kinds of production: measured production, production without wait or delay, maximum production, etc. For example:

Actual Production: includes all wait and delay time.

Normal Production (without delays): includes wait time that is considered normal, but no delay time.

Maximum Production: to figure maximum (or optimum) production, both wait time and delay time are eliminated. The cycle time may be further altered by using an optimum load time.

Example (English)

A job study of a Wheel Tractor-Scraper might yield the following information:

Average wait time	= 0.28 minute
Average load time	= 0.65
Average delay time	= 0.25
Average haul time	= 4.26
Average dump time	= 0.50
Average return time	= 2.09
Average total cycle	= 8.03 minutes
Less wait & delay time	= 0.53
Average cycle 100% eff.	= 7.50 minutes

Weight of haul unit empty — 48,650 lb

Weights of haul unit loaded —
Weighing unit #1 — 93,420 lb
Weighing unit #2 — 89,770 lb
Weighing unit #3 — 88,760 lb
271,950 lb;
average = 90,650 lb

1. Average load weight = 90,650 lb – 48,650 lb = 42,000 lb
2. Bank density = 3125 lb/BCY
3. $\text{Load} = \frac{\text{Weight of load}}{\text{Bank density}}$
   $= \frac{42{,}000 \text{ lb}}{3125 \text{ lb/BCY}} = 13.4 \text{ BCY}$
4. Cycles/hr = $\frac{60 \text{ min/hr}}{\text{Cycle time}} = \frac{60 \text{ min/hr}}{7.50 \text{ min/cycle}} = 80 \text{ cycles/hr}$
5. Production (less delays) = Load/cycle × cycles/hr
   = 13.4 BCY/cycle × 8.0 cycles/hr
   = 107.2 BCY/hr

Example (Metric)

A job study of a Wheel Tractor-Scraper might yield the following information:

Average wait time	= 0.28 minute
Average load time	= 0.65
Average delay time	= 0.25
Average haul time	= 4.26
Average dump time	= 0.50
Average return time	= 2.09
Average total cycle	= 8.03 minutes
Less wait & delay time	= 0.53
Average cycle 100% eff.	= 7.50 minutes

Weight of haul unit empty — 22 070 kg
Weights of haul unit loaded —
Weighing unit #1 — 42 375 kg
Weighing unit #2 — 40 720 kg
Weighing unit #3 — 40 260 kg
123 355 kg;
average = 41 120 kg

1. Average load weight = 41 120 kg – 22 070 kg = 19 050 kg
2. Bank density = 1854 kg/BCM
3. $\text{Load} = \dfrac{\text{Weight of load}}{\text{Bank density}}$

$$= \frac{19\,050 \text{ kg}}{1854 \text{ kg/BCM}} = 10.3 \text{ BCM}$$

4. $\text{Cycles/hr} = \dfrac{60 \text{ min/hr}}{\text{Cycle time}} = \dfrac{60 \text{ min/hr}}{7.50 \text{ min/cycle}} = 80 \text{ cycles/hr}$
5. Production (less delays) = Load/cycle × cycles/hr
   = 10.3 BCM/cycle × 8.0 cycles/hr
   = 82 BCM/hr

● ● ●

ESTIMATING PRODUCTION OFF-THE-JOB

It is often necessary to estimate production of earthmoving machines which will be selected for a job. As a guide, the remainder of the section is devoted to discussions of various factors that may affect production. Some of the figures have been rounded for easier calculation.

Rolling Resistance (RR) is a measure of the force that must be overcome to roll or pull a wheel over the ground. It is affected by ground conditions and load — the deeper a wheel sinks into the ground, the higher the rolling resistance. Internal friction and tire flexing also contribute to rolling resistance. Experience has shown that minimum resistance is approximately 2% (1.5% for radial tires or dual tired trucks) of the gross machine weight (on tires). Resistance due to tire penetration is approximately 1.5% of the gross machine weight for each inch of tire penetration (0.6% for each cm of tire penetration). Thus rolling resistance can be calculated using these relationships in the following manner:

RR = 2% of GMW + 0.6% of GMW per cm tire penetration
RR = 2% of GMW + 1.5% of GMW per inch tire penetration

It's *not* necessary for the tires to actually penetrate the road surface for rolling resistance to increase above the minimum. If the road surface flexes under load, the effect is nearly the same — the tire is always running "uphill". Only on very hard, smooth surfaces with a well compacted base will the rolling resistance approach the minimum.

When actual penetration takes place, some variation in rolling resistance can be noted with various inflation pressures and tread patterns.

NOTE: When figuring "pull" requirements for tracktype tractors, rolling resistance applies only to the trailed unit's *weight on wheels*. Since tracktype tractors utilize steel wheels moving on steel "roads", a tractor's rolling resistance is relatively constant and is accounted for in the Drawbar Pull rating.

Grade Resistance is a measure of the force that must be overcome to move a machine over unfavorable grades (uphill). Grade assistance is a measure of the force that assists machine movement on favorable grades (downhill).

Grades are generally measured in percent slope, which is the ratio between vertical rise or fall and the horizontal distance in which the rise or fall occurs. For example, a 1% grade is equivalent to a 1 m (ft) rise or fall for every 100 m (ft) of horizontal distance; a rise of 4.6 m (15 ft) in 53.3 m (175 ft) equals an 8.6% grade.

$$\frac{\text{4.6 m (rise)}}{\text{53.3 m (horizontal distance)}} = \text{8.6\% grade}$$

$$\frac{\text{15 ft (rise)}}{\text{175 ft (horizontal distance)}} = \text{8.6\% grade}$$

Uphill grades are normally referred to as adverse grades and downhill grades as favorable grades. Grade resistance is usually expressed as a positive (+) percentage and grade assistance is expressed as a negative (–) percentage.

It has been found that for each 1% increment of adverse grade an additional 10 kg (20 lb) of resistance must be overcome for each metric (U.S.) ton of machine weight. This relationship is the basis for determining the Grade Resistance Factor which is expressed in kg/metric ton (lb/U.S. ton):

Grade Resistance Factor = 10 kg/m ton × % grade
= 20 lb/U.S. ton × % grade

Grade resistance (assistance) is then obtained by multiplying the Grade Resistance Factor by the machine weight (GMW) in metric (U.S.) tons.

Grade Resistance = GR Factor × GMW in metric (U.S.) tons

Grade resistance may also be calculated using percentage of gross weight. This method is based on the relationship that grade resistance is approximately equal to 1% of the gross machine weight for 1% of grade.

Grade Resistance = 1% of GMW × % grade

Grade resistance (assistance) affects both wheel and track-type machines.

Total Resistance is the combined effect of rolling resistance (wheel vehicles) and grade resistance. It can be computed by summing the values of rolling resistance and grade resistance to give a resistance in kilogram (pounds) force.

Total Resistance = Rolling Resistance + Grade Resistance

Total resistance can also be represented as consisting completely of grade resistance expressed in percent grade. In other words, the rolling resistance component is viewed as a corresponding quantity of additional adverse grade resistance. Using this approach, total resistance can then be considered in terms of percent grade.

This can be done by converting the contribution of rolling resistance into a corresponding percentage of grade resistance. Since 1% of adverse grade offers a resistance of 10 kg (20 lb) for each metric or (U.S.) ton of machine weight, then each 10 kg (20 lb) of resistance per ton of machine weight can be represented as an additional 1% of adverse grade. Rolling resistance in percent grade and grade resistance in percent grade can then be summed to give Total Resistance in percent or Effective Grade. The following formulas are useful in arriving at Effective Grade.

Rolling Resistance (%) = 2% + 0.6% per cm tire penetration
= 2% + 1.5% per inch tire penetration

Grade Resistance (%) = % grade

Effective Grade (%) = RR (%) + GR (%)

Effective grade is a useful concept when working with Rimpull-Speed-Gradeability curves, Retarder curves, Brake Performance curves, and Travel Time curves.

Traction — is the driving force developed by a wheel or track as it acts upon a surface. It is expressed as usable Drawbar Pull or Rimpull. The following factors affect traction: weight on the driving wheel or tracks, gripping action of the wheel or track, and ground conditions. The coefficient of traction (for any roadway) is the ratio of the maximum pull developed by the machine to the total weight on the drivers.

$$\text{Coeff. of traction} = \frac{\text{Pull}}{\text{weight on drivers}}$$

Therefore, to find the usable pull for a given machine:

Usable pull = Coeff. of traction × weight on drivers

Example: Track-Type Tractor

What usable drawbar pull (DBP) can a 26 800 kg (59,100 lb) Track-type Tractor exert while working on firm earth? on loose earth? (See table section for coefficient of traction.)

Answer:
Firm earth — Usable DBP =
0.90 × 26 800 kg = 24 120 kg
(0.90 × 59,100 lb = 53,190 lb)
Loose earth — Usable DBP =
0.60 × 26 800 kg = 16 080 kg
(0.60 × 59,100 lb = 35,460 lb)

If a load required 21 800 kg (48,000 lb) pull to move it, this tractor could move the load on firm earth. However, if the earth were loose, the tracks would spin.

NOTE: D8R through D11R Tractors may attain higher coefficients of traction due to their suspended undercarriage.

Example: Wheel Tractor-Scraper

What usable rimpull can a 621F size machine exert while working on firm earth? on loose earth? The total loaded weight distribution of this unit is:

Drive unit	Scraper unit
wheels: 23 600 kg (52,000 lb)	wheels: 21 800 kg (48,000 lb)

Remember, use weight on drivers only.
Answer:
Firm earth — 0.55 × 23 600 kg = 12 980 kg
(0.55 × 52,000 lb = 28,600 lb)
Loose earth — 0.45 × 23 600 kg = 10 620 kg
(0.45 × 52,000 lb = 23,400 lb)

On firm earth this unit can exert up to 12 980 kg (28,600 lb) rimpull without excessive slipping. However, on loose earth the drivers would slip if more than 10 620 kg (23,400 lb) rimpull were developed.

●●●

Altitude — Specification sheets show how much pull a machine can produce for a given gear and speed when the engine is operating at rated horsepower. When a standard machine is operated in high altitudes, the engine may require derating to maintain normal engine life. This engine deration will produce less drawbar pull or rimpull.

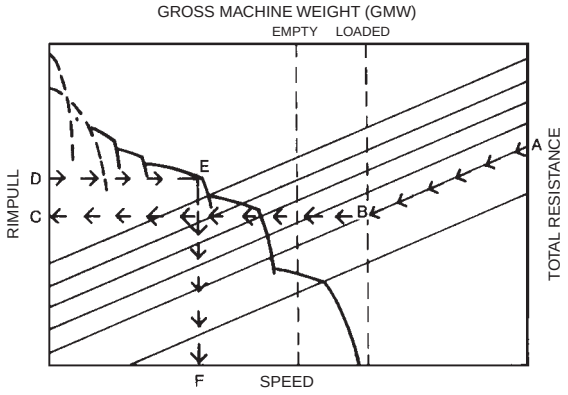
The Tables Section gives the altitude deration in percent of flywheel horsepower for current machines. It should be noted that some turbocharged engines can operate up to 3050 m (10,000 ft) before they require derating. Most machines are engineered to operate up to 1520 m (5000 ft) before they require deration.

The horsepower deration due to altitude must be considered in any job estimating. The amount of power deration will be reflected in the machine's gradeability and in the load, travel, and dump and load times (unless loading is independent of the machine itself).

The example job problem that follows indicates one method of accounting for altitude deration: by increasing the appropriate components of the total cycle time by a percentage equal to the percent of horsepower deration due to altitude. (i.e., if the travel time of a hauling unit is determined to be 1.00 minute at full HP, the time for the same machine derated to 90% of full HP will be 1.10 min.) This is an approximate method that yields reasonably accurate estimates up to 3000 m (10,000 feet) elevation.

Travel time for hauling units derated more than 10% should be calculated as follows using Rimpull-Speed-Gradeability charts.

1) Determine total resistance (grade plus rolling) in percent.



2) Beginning at point A on the chart follow the total resistance line diagonally to its intersection, B, with the vertical line corresponding to the appropriate gross machine weight. (Rated loaded and empty GMW lines are shown dotted.)

3) Using a straight-edge, establish a horizontal line to the left from point B to point C on the rimpull scale.

4) Divide the value of point C as read on the rimpull scale by the percent of total horsepower available after altitude deration from the Tables Section. This yields rimpull value D higher than point C.

5) Establish a horizontal line right from point D. The farthest right intersection of this line with a curved speed range line is point E.

6) A vertical line down from point E determines point F on the speed scale.

7) Multiply speed in kmh by 16.7 (mph by 88) to obtain speed in m/min (ft/min). Travel time in minutes for a given distance in feet is determined by the formula:

$$\text{Time (min)} = \frac{\text{Distance in m (ft)}}{\text{Speed in m/min (ft/min)}}$$

The Travel Time Graphs in sections on Wheel Tractor-Scrapers and Construction & Mining Trucks can be used as an alternative method of calculating haul and/or return times.

Job Efficiency is one of the most complex elements of estimating production since it is influenced by factors such as operator skill, minor repairs and adjustments, personnel delays, and delays caused by job layout. An approximation of efficiency, if no job data is available, is given below.

Operation	Working Hour	Efficiency Factor
Day	50 min/hr	0.83
Night	45 min/hr	0.75

These factors do not account for delays due to weather or machine downtime for maintenance and repairs. You must account for such factors based on experience and local conditions.

●●●●●●●●●●●●●●

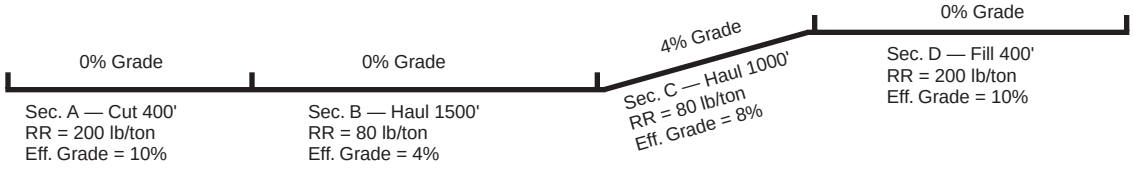
Example problem (English)

A contractor is planning to put the following spread on a dam job. What is the estimated production and cost/BCY?

Equipment:
11 — 631E Series II Wheel Tractor-Scrapers
2 — D9N Tractors with C-dozers
2 — 12G Motor Graders
1 — 825C Tamping Foot Compactor

Material:
Description — Sandy clay; damp, natural bed
Bank Density — 3000 lb/BCY
Load Factor — 0.80
Shrinkage Factor — 0.85
Traction Factor — 0.50
Altitude — 7500 ft

Job Layout — Haul and Return:



Total Effective Grade = RR (%) ± GR (%)
Sec. A: Total Effective Grade = 10% + 0% = 10%
Sec. B: Total Effective Grade = 4% + 0% = 4%
Sec. C: Total Effective Grade = 4% + 4% = 8%
Sec. D: Total Effective Grade = 10% + 0% = 10%

1. Estimate Payload:
Est. load (LCY) × L.F. × Bank Density = payload
31 LCY × 0.80 × 3000 lb/BCY = 74,400 lb payload

2. Establish Machine Weight:
Empty Wt. — 88,000 lb or 44 tons
Wt. of Load — 74,400 lb or 37.2 tons
Total (GMW) — 162,400 lb or 81.2 tons

3. Calculate Usable Pull (traction limitation):
Loaded: (weight on driving wheels = 54%) (GMW)
Traction Factor × Wt. on driving wheels =
0.50 × 162,400 lb × 54% = 43,848 lbs
Empty: (weight on driving wheels = 69%) (GMW)
Traction Factor × Wt. on driving wheels =
0.50 × 88,000 lbs × 69% = 30,360 lbs

4. Derate for Altitude:
Check power available at 7500 ft from altitude deration table in the Tables Section.
631E Series II — 100% 12G — 85%
D9N — 100% 825C — 94%

Then adjust if necessary:

Load Time — controlled by D9N, at 100% power, no change.

Travel, Maneuver and Spread time — 631E Series II, no change.

5. Compare Total Resistance to Tractive Effort on haul:

Grade Resistance —

GR = lb/ton × tons × adverse grade in percent

Sec. C: = 20 lb/ton × 81.2 tons × 4% grade = 6496 lb

Rolling Resistance —

RR = RR Factor (lb/ton) × GMW (tons)

Sec. A: = 200 lb/ton × 81.2 tons = 16,240 lb
Sec. B: = 80 lb/ton × 81.2 tons = 6496 lb
Sec. C: = 80 lb/ton × 81.2 tons = 6496 lb
Sec. D: = 200 lb/ton × 81.2 tons = 16,240 lb

Total Resistance —

TR = RR + GR

Sec. A: = 16,240 lb + 0 = 16,240 lb
Sec. B: = 6496 lb + 0 = 6496 lb
Sec. C: = 6496 lb + 6496 lb = 12,992 lb
Sec. D: = 16,240 lb + 0 = 16,240 lb

Check usable pounds pull against maximum pounds pull required to move the 631E.

Pull usable … 43,848 lb loaded

Pull required … 16,240 lb maximum total resistance

Estimate travel time for haul from 631E (loaded) travel time curve; read travel time from distance and effective grade.

Travel time (from curves):

Sec. A: 0.60 min
Sec. B: 1.00
Sec. C: 1.20
Sec. D: 0.60
3.40 min

NOTE: This is an estimate only; it *does not account for all the acceleration and deceleration time*, therefore it is not as accurate as the information obtained from a computer program.

6. Compare Total Resistance to Tractive Effort on return:

Grade Assistance —

GA = 20 lb/ton × tons × negative grade in percent

Sec. C: = 20 lb/ton × 44 tons × 4% grade = 3520 lbs

Rolling Resistance —

RR = RR Factor × Empty Wt (tons)

Sec. D: = 200 lb/ton × 44 tons = 8800 lb
Sec. C: = 80 lb/ton × 44 tons = 3520 lb
Sec. B: = 80 lb/ton × 44 tons = 3520 lb
Sec. A: = 200 lb/ton × 44 tons = 8800 lb

Total Resistance —

TR = RR – GA

Sec. D: = 8800 lb – 0 = 8800 lb
Sec. C: = 3520 lb – 3520 lb = 0
Sec. B: = 3520 lb – 0 = 3520 lb
Sec. A: = 8800 lb – 0 = 8800 lb

Check usable pounds pull against maximum pounds pull required to move the 631E.

Pounds pull usable … 30,360 lb empty

Pounds pull required … 8800 lb

Estimate travel time for return from 631E empty travel time curve.

Travel time (from curves):

Sec. D: 0.40 min
Sec. C: 0.55
Sec. B: 0.80
Sec. A: 0.40
2.15 min

7. Estimate Cycle Time:

Total Travel Time (Haul plus Return)	= 5.55 min
Adjusted for altitude: 100% × 5.55 min	= 5.55 min
Load Time	0.7 min
Maneuver and Spread Time	0.7 min
Total Cycle Time	6.95 min

8. Check pusher-scraper combinations:

Pusher cycle time consists of load, boost, return and maneuver time. Where actual job data is not available, the following may be used.

Boost time = 0.10 minute
Return time = 40% of load time
Maneuver time = 0.15 minute
Pusher cycle time = 140% of load time + 0.25 minute
Pusher cycle time = 140% of 0.7 min + 0.25 minute
= 0.98 + 0.25 = 1.23 minute

Scraper cycle time divided by pusher cycle time indicates the number of scrapers which can be handled by each pusher.

$$\frac{6.95 \text{ min}}{1.23 \text{ min}} = 5.65$$

Each push tractor is capable of handling five plus scrapers. Therefore the two pushers can adequately serve the eleven scrapers.

9. Estimate Production:

Cycles/hour = 60 min ÷ Total cycle time
= 60 min/hr ÷ 6.95 min/cycle
= 8.6 cycles/hr

Estimated load = Heaped capacity × L.F.
= 31 LCY × 0.80
= 24.8 BCY

Hourly unit production = Est. load × cycles/hr
= 24.8 BCY × 8.6 cycles/hr
= 213 BCY/hr

Adjusted production = Efficiency factor × hourly production
= 0.83 (50 min hour) × 213 BCY
= 177 BCY/hr

Hourly fleet production = Unit production × No. of units
= 177 BCY/hr × 11
= 1947 BCY/hr

10. Estimate Compaction:

Compaction requirement = S.F. × hourly fleet production
= 0.85 × 1947 BCY/hr
= 1655 CCY/hr

Compaction capability (given the following):

Compacting width, 7.4 ft	(W)
Average compacting speed, 6 mph	(S)
Compacted lift thickness, 7 in	(L)
No. of passes required, 3	(P)

825C production =

$$\text{CCY/hr} = \frac{W \times S \times L \times 16.3}{P} \quad \text{(conversion constant)}$$

$$= \frac{7.4 \times 6 \times 7 \times 16.3}{3}$$

= 1688 CCY/hr

Given the compaction requirement of 1655 CCY/hr, the 825C is an adequate compactor match-up for the rest of the fleet. However, any change to job layout that would increase fleet production would upset this balance.

11. Estimate Total Hourly Cost:

631E	@ $65.00/hr ×	11 units	$715.00
D9N	@ 75.00/hr ×	2 units	150.00
12G	@ 15.00/hr ×	2 units	30.00
825C	@ 40.00/hr ×	1 unit	40.00
Operators	@ 20.00/hr ×	16 men	320.00
Total Hourly Owning and Operating Cost			$1,255.00

12. Calculate Performance:

$$\text{Cost per BCY} = \frac{\text{Total cost/hr}}{\text{Production/hr}}$$

$$= \frac{\$1{,}255.00}{1947 \text{ BCY/hr}}$$

= 64¢ BCY

NOTE: Ton-MPH calculations should be made to judge the ability of the tractor-scraper tires to operate safely under these conditions.

13. Other Considerations:

If other equipment such as rippers, water wagons, discs or other miscellaneous machines are needed for the particular operation, then these machines must also be included in the cost per BCY.

●●●

Example problem (Metric)

A contractor is planning to put the following spread on a dam job. What is the estimated production and cost/BCM?

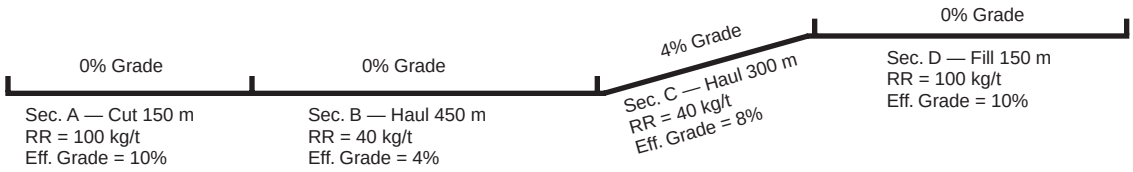
Equipment:

11 — 631E Wheel Tractor-Scrapers
2 — D9N Tractors with C-dozers
2 — 12G Motor Graders
1 — 825C Tamping Foot Compactor

Material:

Description — Sandy clay; damp, natural bed
Bank Density — 1770 kg/BCM
Load Factor — 0.80
Shrinkage Factor — 0.85
Traction Factor — 0.50
Altitude — 2300 meters

Job Layout — Haul and Return:



Total Effective Grade = RR (%) ± GR (%)
Sec. A: Total Effective Grade = 10% + 0% = 10%
Sec. B: Total Effective Grade = 4% + 0% = 4%
Sec. C: Total Effective Grade = 4% + 4% = 8%
Sec. D: Total Effective Grade = 10% + 0% = 10%

1. Estimate Payload:
Est. load (LCM) × L.F. × Bank Density = payload
24 LCM × 0.80 × 1770 kg/BCM = 34 000 kg payload

2. Machine Weight:
Empty Wt. — 40 000 kg or 40 metric tons
Wt. of Load — 34 000 kg or 34 metric tons
Total (GMW) — 74 000 kg or 74 metric tons

3. Calculate Usable Pull (traction limitation):
Loaded: (weight on driving wheels = 54%) (GMW)
Traction Factor × Wt. on driving wheels =
0.50 × 74 000 kg × 54% = 19 980 kg
Empty: (weight on driving wheels = 69%) (GMW)
Traction Factor × Wt. on driving wheels =
0.50 × 40 000 kg × 69% = 13 800 kg

4. Derate for Altitude:
Check power available at 2300 m from altitude deration table in the Tables Section.
631E — 100% 12G — 85%
D9N — 100% 825C — 94%

Then adjust if necessary:
Load Time — controlled by D9N, at 100% power, no change.
Travel, Maneuver and Spread time — 631E, no change.

5. Compare Total Resistance to Tractive Effort on haul:
Grade Resistance —
GR = 10 kg/metric ton × tons × adverse grade in percent
Sec. C: = 10 kg/metric ton × 74 metric tons × 4% grade = 2960 kg

Rolling Resistance —
RR = RR Factor (kg/mton) × GMW (metric tons)
Sec. A: = 100 kg/metric ton × 74 metric tons = 7400 kg
Sec. B: = 40 kg/metric ton × 74 metric tons = 2960 kg
Sec. C: = 40 kg/metric ton × 74 metric tons = 2960 kg
Sec. D: = 100 kg/metric ton × 74 metric tons = 7400 kg

Total Resistance —
TR = RR + GR
Sec. A: = 7400 kg + 0 = 7400 kg
Sec. B: = 2960 kg + 0 = 2960 kg
Sec. C: = 2960 kg + 2960 kg = 5920 kg
Sec. D: = 7400 kg + 0 = 7400 kg

Check usable kilogram force against maximum kilogram force required to move the 631E.
Force usable … 19 980 kg loaded
Force required … 7400 kg maximum total resistance

Estimate travel time for haul from 631E (loaded) travel time curve; read travel time from distance and effective grade.
Travel time (from curves):
Sec. A: 0.60 min
Sec. B: 1.00
Sec. C: 1.20
Sec. D: 0.60
3.40 min

NOTE: This is an estimate only; it *does not account for all the acceleration and deceleration time*, therefore it is not as accurate as the information obtained from a computer program.

6. Compare Total Resistance to Tractive Effort on return:
Grade Assistance —
GA = 10 kg/mton × metric tons × negative grade in percent
Sec. C: = 10 kg/metric ton × 40 metric ton × 4% grade = 1600 kg

Rolling Resistance —

RR = RR Factor × Empty Wt.

Sec. D: = 100 kg/metric ton × 40 metric tons
= 4000 kg

Sec. C: = 40 kg/metric ton × 40 metric tons
= 1600 kg

Sec. B: = 40 kg/metric ton × 40 metric tons
= 1600 kg

Sec. A: = 100 kg/metric ton × 40 metric tons
= 4000 kg

Total Resistance —

TR = RR – GA

Sec. D: = 4000 kg – 0 = 4000 kg
Sec. C: = 1600 kg – 1600 kg = 0
Sec. B: = 1600 kg – 0 = 1600 kg
Sec. A: = 4000 kg – 0 = 4000 kg

Check usable kilogram force against maximum force required to move the 631E.

Kilogram force usable … 13 800 kg empty
Kilogram force required … 4000 kg

Estimate travel time for return from 631E empty travel time curve.

Travel time (from curves):
Sec. D: 0.40 min
Sec. C: 0.55
Sec. B: 0.80
Sec. A: 0.40
2.15 min

7. Estimate Cycle Time:

Total Travel Time (Haul plus Return)	= 5.55 min
Adjusted for altitude: 100% × 5.55 min	= 5.55 min
Load Time	0.7 min
Maneuver and Spread Time	0.7 min
Total Cycle Time	6.95 min

8. Check pusher-scraper combinations:

Pusher cycle time consists of load, boost, return and maneuver time. Where actual job data is not available, the following may be used.

Boost time = 0.10 minute
Return time = 40% of load time
Maneuver time = 0.15 minute
Pusher cycle time = 140% of load time + 0.25 minute
Pusher cycle time = 140% of 0.7 min + 0.25 minute
= 0.98 + 0.25 = 1.23 minute

Scraper cycle time divided by pusher cycle time indicates the number of scrapers which can be handled by each pusher.

$$\frac{6.95 \text{ min}}{1.23 \text{ min}} = 5.65$$

Each push tractor is capable of handling five plus scrapers. Therefore the two pushers can adequately serve the eleven scrapers.

9. Estimate Production:

Cycles/hour	= 60 min ÷ Total cycle time = 60 min/hr ÷ 6.95 min/cycle = 8.6 cycles/hr
Estimated load	= Heaped capacity × L.F. = 24 LCM × 0.80 = 19.2 BCM
Hourly unit production	= Est. load × cycles/hr = 19.2 BCM × 8.6 cycles/hr = 165 BCM
Adjusted production	= Efficiency factor × hourly production = 0.83 (50 min hour) × 165 BCM = 137 BCM/hour
Hourly fleet production	= Unit production × No. of units = 137 BCM/hr × 11 units = 1507 BCM/hr

10. Estimate Compaction:

Compaction requirement = S.F. × hourly fleet production
= 0.85 × 1507 BCM/hr
= 1280 CCM/hr

Compaction capability (given the following):

Compacting width, 2.26 m	(W)
Average compacting speed, 9.6 km/h	(S)
Compacted lift thickness, 18 cm	(L)
No. of passes required, 3	(P)

825C production =

$$\text{CCM/hr} = \frac{W \times S \times L \times 10}{P} \text{ (conversion factor)}$$

$$= \frac{2.26 \times 9.6 \times 18 \times 10}{3}$$

= 1302

Given the compaction requirement of 1280 CCM/h, the 825C is an adequate compactor match-up for the rest of the fleet. However, any change to job layout that would increase fleet production would upset this balance.

11. Estimate Total Hourly Cost:

631E	@ $65.00/hr × 11 units	$715.00
D9N	@ 75.00/hr × 2 units	150.00
12G	@ 15.00/hr × 2 units	30.00
825C	@ 40.00/hr × 1 unit	40.00
Operators	@ 20.00/hr × 16 men	320.00
Total Hourly Owning and Operating Cost		$1,255.00

12. Calculate Performance:

$$\text{Cost per BCM} = \frac{\text{Total cost/hr}}{\text{Production/hr}}$$

$$= \frac{\$1{,}255.00}{1507 \text{ BCM/hr}}$$

$$= 83¢/\text{BCM}$$

NOTE: Ton-km/h calculations should be made to judge the ability of the tractor-scraper tires to operate safely under these conditions.

13. Other Considerations:

If other equipment such as rippers, water wagons, discs or other miscellaneous machines are needed for the particular operation, then these machines must also be included in the cost per BCM.

SYSTEMS

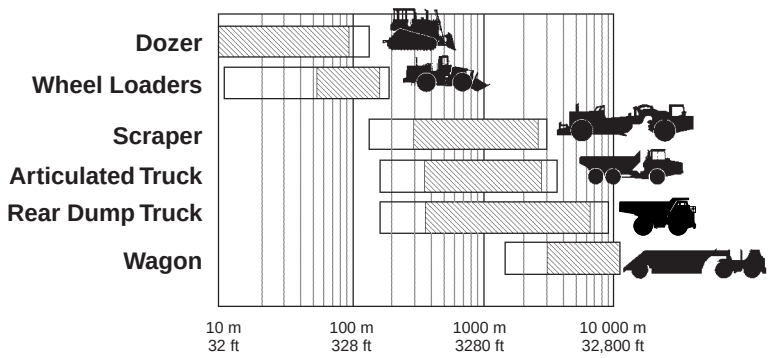
Caterpillar offers a variety of machines for different applications and jobs. Many of these separate machines function together in mining and earthmoving systems.

- Bulldozing with track-type tractors
- Load-and-Carry with wheel loaders
- Scrapers self-loading with elevator, auger, or push-pull configurations, or push-loaded by track-type tractors
- Articulated trucks loaded by excavators, track loaders or wheel loaders
- Off-highway trucks loaded by shovels, excavators or wheel loaders

Economic Haul Distances — Mobile equipment systems for construction or mining jobs operate in generalized economic application zones. These zones vary by machine with distance, underfoot conditions, grades, material type, production rate and operator skill. Of these factors, distance provides the best initial basis for system selection. The following table provides general rules of thumb for systems applcation based on distance. These haul ranges will vary by application.

● ● ●

GENERAL HAUL DISTANCES FOR MOBILE SYSTEMS



HAUL DISTANCE

Loading Match — Loading tools have a production range that varies with material, bucket configuration, target size, operator skill and load area conditions. The loader/truck matches given in the following table are with the typical number of passes and production range.

Your Cat Dealer can provide advice and estimates based on your specific conditions.

FUEL CONSUMPTION AND PRODUCTIVITY

Fuel efficiency is the term used to relate fuel consumption and machine productivity. It is expressed in units of material moved per volume of fuel consumed. Common units are cubic meters or tonnes per liter of fuel (cubic yards or tons/gal). Determining fuel efficiency requires measuring both fuel consumption and production.

Measuring fuel consumption involves tapping into the vehicle's fuel supply system — without contaminating the fuel. The amount of fuel consumed during operation is then measured on a weight or volumetric basis.

FORMULAS AND RULES OF THUMB

Production, hourly = Load (BCM) cycle × cycles/hr
= Load (BCY) cycle × cycles/hr

$$\textit{Load Factor (L.F.)} = \frac{100\%}{100\% + \%\ \text{swell}}$$

Load (bank measure) = Loose cubic meters (LCM) × L.F.
= Loose cubic yards (LCY) × L.F.

$$\textit{Shrinkage Factor (S.F.)} = \frac{\text{Compacted cubic meters (or yards)}}{\text{Bank cubic meters (or yards)}}$$

Density = Weight/Unit Volume

$$\textit{Load (bank measure)} = \frac{\text{Weight of load}}{\text{Bank density}}$$

Rolling Resistance Factor
= 20 kg/t × (6 kg/t/cm × cm)
= 40 lb/ton + (30 lb/ton/inch × inches)

Rolling Resistance
= RR Factor (kg/t) × GMW (tons)
= RR Factor (lb/ton) × GMW (tons)

Rolling Resistance
= 2% of GMW + 0.6% of GMW per cm tire penetration
= 2% of GMW + 1.5% of GMW per inch tire penetration

$$\%\ \text{Grade} = \frac{\text{vertical change in elevation (rise)}}{\text{corresponding horizontal distance (run)}}$$

Grade Resistance Factor = 10 kg/m ton × % grade
= 20 lb/ton × % grade

Grade Resistance = GR Factor (kg/t) × GMW (tons)
= GR Factor (lb/ton) × GMW (tons)

Grade Resistance = 1% of GMW × % grade

Total Resistance
= Rolling Resistance (kg or lb) + Grade Resistance (kg or lb)

Total Effective Grade (%) = RR (%) + GR (%)

Usable pull (traction limitation) = Coeff. of traction × weight on drivers
= Coeff. of traction × (Total wt × % on drivers)

Pull required = Rolling Resistance + Grade Resistance
= Total Resistance

Total Cycle Time = Fixed time + Variable time

Fixed time: See respective machine production section.

Variable time = Total haul time + Total return time

$$\textit{Travel Time} = \frac{\text{Distance (m)}}{\text{Speed (m/min)}}$$
$$= \frac{\text{Distance (ft)}}{\text{Speed (fpm)}}$$

$$\textit{Cycles per hour} = \frac{60\ \text{min/hr}}{\text{Total cycle time (min/cycle)}}$$

Adjusted production = Hourly production × Efficiency factor

$$\textit{No. of units required} = \frac{\text{Hourly production required}}{\text{Unit hourly production}}$$

$$\textit{No. of scrapers a pusher will load} = \frac{\text{Scraper cycle time}}{\text{Pusher cycle time}}$$

Pusher cycle time (min) = 1.40 Load time (min) + 0.25 min

$$\textit{Grade Horsepower} = \frac{\text{GMW (kg)} \times \text{Total Effective Grade} \times \text{Speed (km/h)}}{273.75}$$
$$= \frac{\text{GMW (lb)} \times \text{Total Effective Grade} \times \text{Speed (mph)}}{375}$$

Notes —

STOCKPILE COAL HANDLING

CONTENTS

INTRODUCTION

Efficient methods have been developed for handling and storing coal with mobile equipment. Generally, a power plant or other industrial facility which uses coal, meets its daily requirements with incoming coal shipments and will maintain an emergency stockpile or deadpile. The deadpile is designed to meet the burn requirements during any interruption of coal shipments. Interruptions may include inclement weather, carrier strikes, scheduling problems, etc.

The deadpile will contain approximately a 90 day supply of coal and is constructed by thoroughly compacting lifts, or layers, of coal approximately 15 cm (6 in) thick. Thorough compaction of the entire stockpile, including the sides, eliminates air spaces, reducing the possibility of spontaneous combustion.

Reclaiming the deadpiled coal is critical when incoming shipments are not able to satisfy the burn requirements. Four basic types of mobile equipment are available for stockpiling and reclaiming coal — track-type tractors, wheel tractors, wheel loaders, and wheel tractor-scrapers. Each type has its own specific advantages. The equipment selected must be able to meet the maximum hourly burn rate.

MACHINE SELECTION

Track-Type Tractors

Track-type tractors continue to be the most widely used machines for coal handling operations. Equipped with a U-shaped coal dozer, they are suitable for meeting high production requirements over dozing distances of less than 152 m (500 ft). Their tractive capabilities and gradeability permit them to operate on the sides of the stockpile and surge pile which often prove inaccessible to other types of equipment. They can also remove snow and frost penetrated coal from the stockpile surface so that rubber-tired equipment can work efficiently.

Wheel Tractors

These machines, with their long wheel base, low center of gravity, and articulated design, offer good stability and maneuverability. They have the ability to travel at a higher speed than the track-type tractor, moving easily from one area of operation to another, and provide greater compactive effort with fewer passes. They are capable of performing some utility functions. However, their coefficient of traction is less than that of track-type tractors. The most efficient dozing distance for the wheel tractor is usually less than 152 m (500 ft).

Coal scoops are also available for wheel tractors and may improve production under certain operating conditions.

Wheel Loaders

As dozing and hauling distances increase, wheel loaders are able to effectively move coal in load-and-carry operations. Since coal is a relatively light material, the loaders should be equipped with larger buckets sized for coal density. Versatility and mobility allow them to perform a variety of tasks, both on and off the stockpile. They can load trucks or railcars, dig out bottom ash and boiler slag from the ash storage areas, and move railcars within the vicinity of the power plant. Generally wheel loaders are more efficient than track or wheel tractors at distances of 122 m (400 ft) or more.

Coal Scrapers

Tandem powered coal scrapers are generally used when large volumes and long haul distances [over 152 m (500 ft)] are involved. They are able to effectively self-load coal, and have the advantage of being able to provide both high speed and large capacity; in addition, scrapers provide the greatest compactive effort. Coal scrapers are even more effective when top loading systems and drive-over reclaiming hoppers are used.

HOW TO EQUIP

Counterweighting

While larger blades or buckets allow for greater production, counterweighting is often necessary to improve the machine's balance and handling capability. For track-type tractors, a rear counterweight is recommended. Wheel machines use various methods to add weight. For example, scoop dozers use front counterweights, and wheel machines often use tire ballast. Below is a weight comparison of the Caterpillar standard U-blade to the Coal Dozer, along with the recommended counterweight for D11R, D10R, D9R, D8R, and 834B.

COAL STOCKPILE BLADE WEIGHT COMPARISON/ COUNTERWEIGHTING

Model	U-Blade		Coal Dozer/ Scoop		Counterweight	
	kg	lb	kg	lb	kg	lb
D11R	11 608	**25,590**	11 340	**25,000**	4989	**11,000**
D10R	6188	**13,643**	6440	**14,200**	2928	**6456**
D9R	4179	**9214**	4490	**9900**	3142	**6926**
D8R	2825	**6228**	3200	**7050**	2749	**6060**
834B	2994	**6600**	3630	**8000**	75% $CaCl_2$ in all tires —	
*834B with Scoop			8700	**19,180**	5360	**11,816**

Weights include blade or scoop only. The change in machine weight is determined by adding or subtracting the difference between the two blades. Counterweight or ballast may also need to be considered.

Track Shoe Width

Track shoes are an important consideration since shoe width determines tractive capability and compaction. Depending on the coal being stockpiled, the utility company will often have a strong preference concerning track shoe width. Basically, utilities stockpiling low rank or sub-bituminous rank lignite coal usually prefer the standard shoe width for maximum compactive effort to reduce the possibility of spontaneous combustion.

Utilities burning medium or high rank bituminous coals are not as concerned with spontaneous combustion and sometimes prefer a wider shoe that allows increased tractive capability on loose or less densely compacted coal stockpiles.

Tires

Many utility companies have established a tire preference for wheel machines. Normally a radial tire allows for the maximum tire print in the stockpile surface providing the best traction.

Tire pressure may be of equal importance to tire selection. Tests with hydro-inflated (liquid ballasting) tires indicate that inflation pressure of approximately 275 kPa (40 psi) improves machine performance over higher inflation pressure. Lower than 275 kPa (40 psi) is not recommended for hydro-inflated tires. (For more hydro-inflation information see the Tire section.)

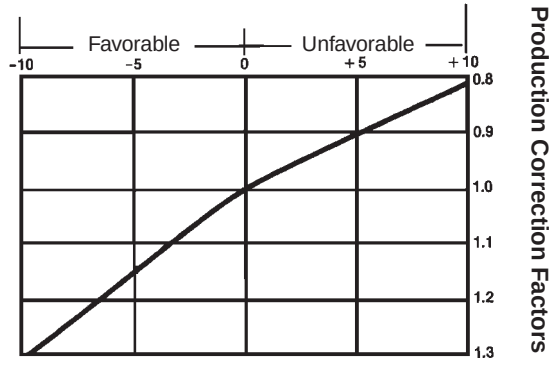
Other

The 834B's performance may be improved in the varying underfoot conditions of a coal stockpile with the use of a Detroit NoSPIN differential. This differential provides added tractive capability on all coal piles, particularly loose coal.

PRODUCTION FACTORS

1. *The effect of grade* — dozer production will increase 3% for each 1% of favorable grade and decrease 2% for each 1% of adverse grade up to grades of 10%. The graph below exemplifies this point.

Effect of Grade on Production
% Grade



As a rule of thumb, track-type tractors can negotiate grades of about 60% in *loose* coal. Wheel tractor dozers can negotiate grades up to 25% on fairly well *compacted* coal.

2. *Slot dozing*, which consists of dozing repeatedly in the same tracks, will increase production. The deeper the slot, the greater the increase in production. Obviously this will disrupt the surface of the pile; however it does provide maximum production.

Slot Condition	Slot Depth	Increase in Production
Slight	60 cm ~ **2 ft**	10%
Consistent	60 cm-1.5 m ~ **2-5 ft**	25%
Very Consistent	Over 1.5 m ~ **Over 5 ft**	30% +

3. *Relative traction* — machines will provide greater tractive effort as the compaction beneath them increases.

Condition	Machine	Coefficient of Traction
Well Compacted Coal	Track-type	*0.75-0.80
	Wheel	0.40-0.50
Loose Coal	Track-type	*0.60
	Wheel	0.30-0.40

*D11R, D10R, D9R and D8R will often achieve a higher coefficient of traction due to their suspended undercarriage.

4. *Rolling Resistance* of rubber tired equipment will decrease as the compaction of the coal beneath the machines increases. Here are total rolling resistances on various surfaces.

	kg/Metric Ton	lb/U.S. Ton
• Main travel area from loading area to stockpile traveled and maintained.	29	**65**
• Travel over the compacted deadpile.	36	**80**
• Travel over thin lifts of uncompacted coal on the deadpile.	54	**120**
• Travel on loose piles under stacking conveyor or on a windrow.	90-136	**200-300**

5. *The degree of compaction required* — for medium and high rank bituminous coal, track-type tractors will normally provide ample compaction to prevent fires. For low rank coals, such as sub-bituminous and lignite, rubber tired machines, pneumatic compactors or sealing may be required to prevent fires. The following table illustrates the compaction that is possible if the coal is spread in thin lifts and the machine makes a sufficient number of passes over the entire lift surface.

Machine	kg/m³	lb/ft³	lb/yd³
Track-type Tractors	960-1160	**60-72**	**1620-1950**
Wheel Tractors	1040-1200	**65-75**	**1750-2030**
Wheel Loaders	1040-1250	**65-78**	**1750-2110**
Wheel Tractor-Scrapers	1100-1280	**68-80**	**1840-2160**

25

ESTIMATING HOURLY PRODUCTION

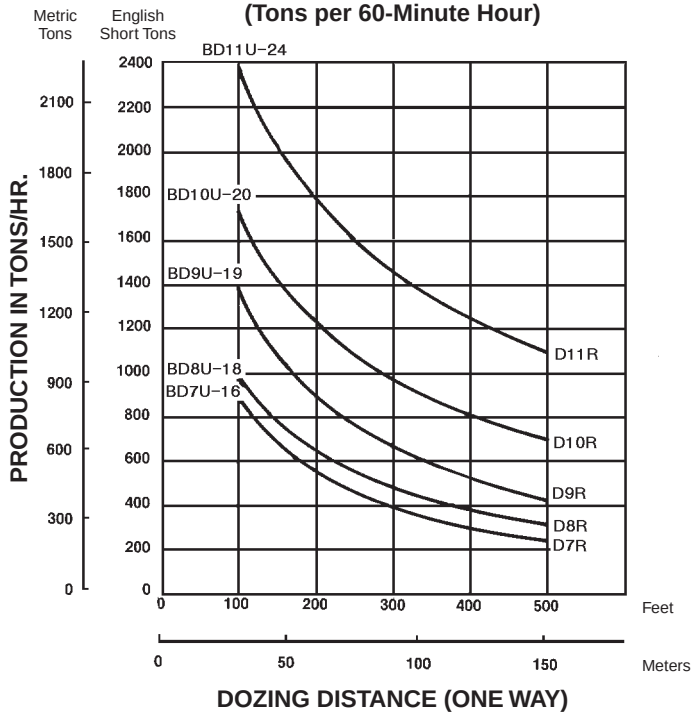
The following graphs may be used for estimating the hourly production of machines handling mixed bituminous coal. The graphs are based on 100% machine efficiency under normal job conditions and average operator; they do not take into account adverse grades, downtime, wait time, poor traction, etc. These production estimates should be evaluated in light of individual job conditions and efficiency. Moreover, a job efficiency correction factor should be applied to the production estimate shown when using these graphs.

To estimate travel times for a specific machine refer to the performance graphs or charts in the appropriate model section of this book.

NOTE: Capacities and production curves on the next pages are based on bituminous coal with a density of 890 kg/m³ or 1500 lb/yd³ or 55 lb/ft³. For sub-bituminous coal with a density of 800 kg/m³ or 1350 lb/yd³ or 50 lb/ft³ multiply tonnage figure by .90. For lignite with an average density of 710 kg/m³ or 1200 lb/yd³ or 45 lb/ft³ multiply tonnage figure by .80.

Track-Type Tractors Estimated Production with U-Blade (Coal Dozer)

Factors:
- **Mixed Bituminous Coal**
- **Storage and Reclamation**
- **0% Grade**
- **.80 Coefficient of Traction**



NOTE: This chart is based on numerous field studies made under varying job conditions. Refer to correction factors following these charts.

	U-Blade			Blade Capacities			
Tractor	**Model**	**m**	**ft**	**Metric tons**	**U.S. tons**	**m^3**	**yd^3**
D11R	BD11U-24	7.32	**24'**	66.7	**73.5**	74.9	**98**
D10R	BD10U-20	6.10	**20'**	40.85	**45.0**	45.9	**60**
D9R	BD9U-19	5.79	**19'**	32.6	**35.9**	36.5	**47.8**
D8R	BD8U-18	5.49	**18'**	19.0	**21.0**	21.4	**28**
D7R	BD7U-16	4.88	**16'**	14.28	**15.75**	16.05	**21**
D6R	BD6U	4.27	**14'**	8.84	**9.75**	9.9	**13**

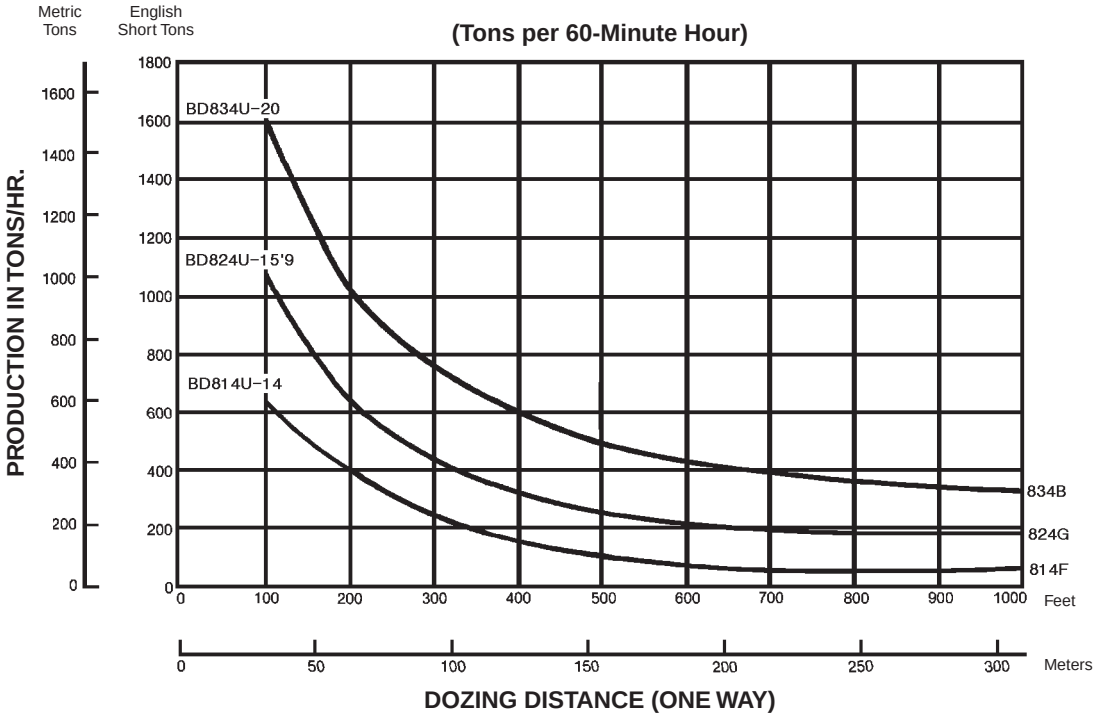
Refer to Track-Type Tractor/Bulldozer section for additional special attachment specifications.

Wheel Tractors Estimated Production with U-Blade (Coal Dozer)

NOTE: This chart is based on numerous field studies made under varying job conditions. Refer to correction factors following these charts.

Factors:

- **Mixed Bituminous Coal**
- **Storage and Reclamation**
- **0% Grade**
- **.80 Coefficient of Traction**



Tractor	U-Blade			Blade Capacities			
	Model	m	ft	Metric tons	U.S. tons	m^3	yd^3
834B	BD834U-20	6.17	**20'3"**	18.8	**20.8**	21.2	**27.7**
824G	BD824U-15'9	4.79	**15'9"**	14.2	**15.7**	16.1	**21.0**
814F	BD814U-14	4.32	**14'2"**	9.4	**10.3**	10.6	**13.8**

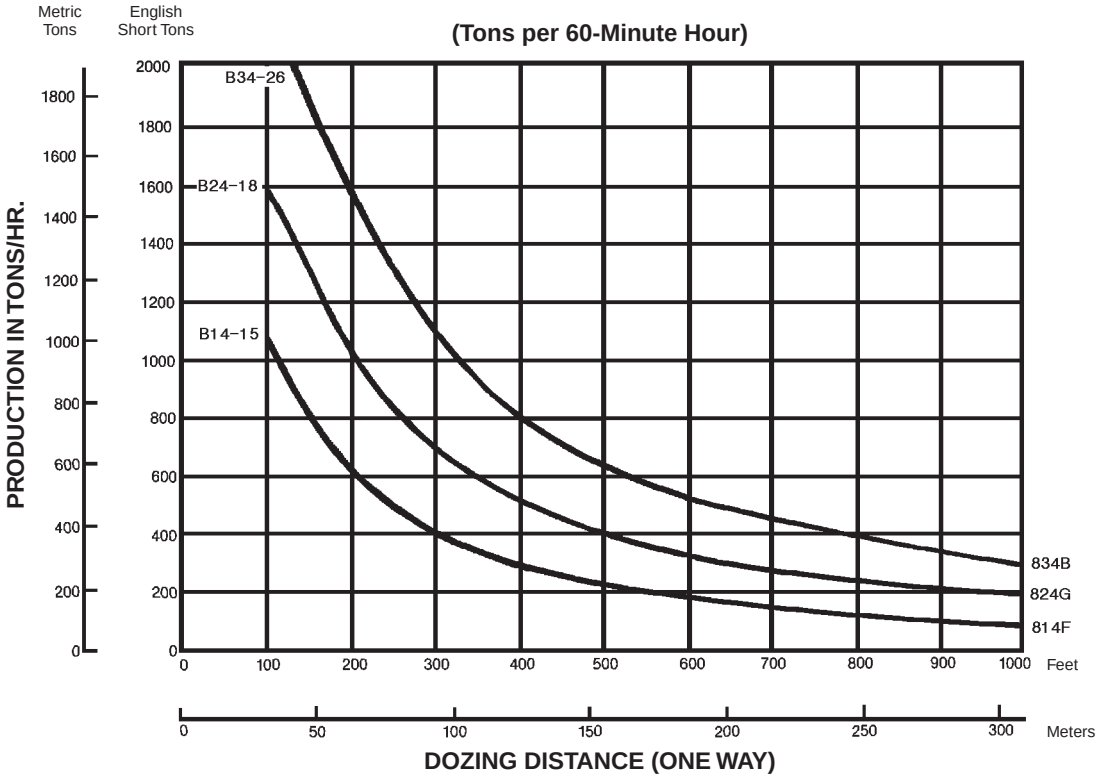
NOTE: Blade capacities in tons figured using weight of coal at 890 kg/m^3 **(1500 lb/yd^3).**

Refer to Track-Type Tractor/Bulldozer section for additional special attachment specifications.

Wheel Tractors Estimated Production with Coal Scoop

Factors:

- **Mixed Bituminous Coal**
- **Storage and Reclamation**
- **0% Grade**
- **.80 Coefficient of Traction**



Tractor	Coal Scoop			Scoop Capacities (Lift and Carry)				Doze Capacities			
	Model	m	ft	Metric tons	U.S. tons	m^3	yd^3	Metric tons	U.S. tons	m^3	yd^3
834B	B34-26	5.3	**17'4"**	18.3	**20.2**	19.9	**26**	37.5	**41.25**	37.5	**49**
824G	B24-17	4.0	**13'2"**	12.3	**13.5**	13.0	**17**	24.5	**27.0**	26.0	**34**
814F	B14-15	3.7	**12'3"**	8.2	**9.0**	11.5	**15**	16.3	**18.0**	19.1	**25**

Refer to Track-Type Tractor/Bulldozer section for additional special attachment specifications.

Wheel Loaders Estimated Production with Coal Bucket

Factors:

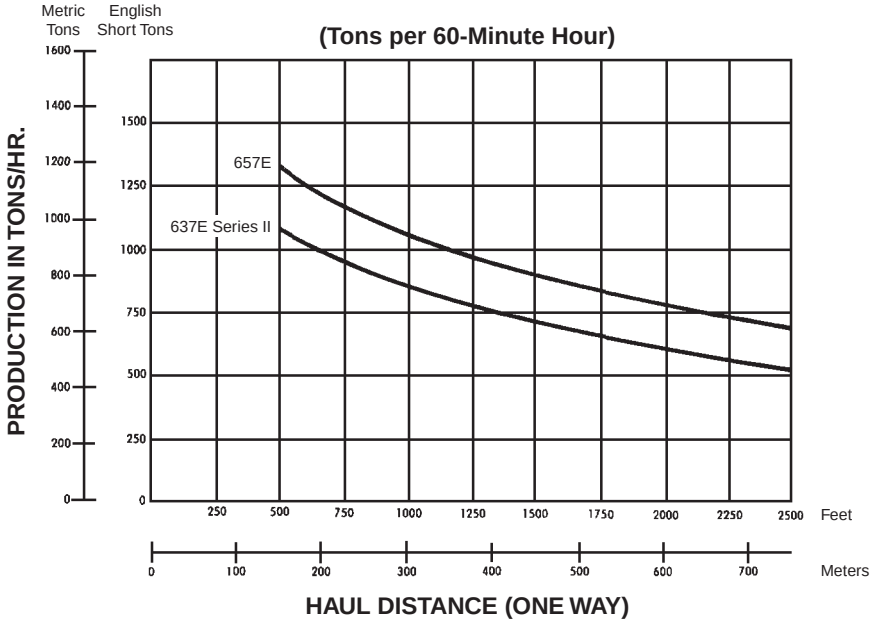
- **Mixed Bituminous Coal**
- **Storage and Reclamation**
- **0% Grade**
- **.80 Coefficient of Traction**

	Coal Bucket	Bucket Capacities			
Loader	**Model**	**Metric tons**	**U.S. tons**	**m^3**	**yd^3**
992G	B92-25	17.0	**18.8**	19.3	**25.25**
988F	B88-14	9.4	**10.4**	10.3	**13.5**
980G	B80-11	7.3	**8.1**	8.2	**10.75**
966G	B66-7	4.8	**5.3**	5.5	**7.25**

NOTE: Bucket capacities include bottom cutting edge in tons figured using weight of coal at 890 kg/m^3 **(1500 lb/yd^3)**.

Wheel Tractor-Scrapers Estimated Production

Factors:
- **Mixed Bituminous Coal**
- **Storage and Reclamation**
- **0% Grade**
- **.50 Coefficient of Traction**



Coal Scraper	Bowl Capacities									
	Metric tons	U.S. tons	Struck		1:1		2:1		3:1	
			m^3	yd^3	m^3	yd^3	m^3	yd^3	m^3	yd^3
657E	49.9	**55**	45	**59**	56	**73**	50	**65**	47	**62**
637E Series II	34.5	**38**	31	**41**	38	**50**	34	**45**	37	**44**

Average fixed time to load, maneuver and dump:
657E — 1.12 min.
637E Series II — 1.10 min.

NOTE:

- The 657E Coal Scraper is 1049 mm (41.3") longer and bowl sides and apron are 1080 mm (42.5") higher than its earthmoving counterpart.
- The 637E Series II Coal Scraper is 762 mm (30") longer and bowl sides, apron and ejector are 915 mm (36") higher than its earthmoving counterpart.
- The rimpull, travel times, and retarder performance for the coal scrapers are the same as for the standard machines. See Wheel Tractor-Scrapers section for charts and graphs.

Example Problem

A coal-fired utility company has a coal requirement of approximately 315 metric tons (350 tons) per hour. Specify the coal handling machine that will satisfy this demand.

Conditions:

Lignite Coal 710 kg/m^3 (1200 lb/yd^3)
90 m (300 ft) push distance
5% adverse grade
50 minute hour operation efficiency

Solution:

Calculate the D9R's production equipped with the BD9U-19 Coal U-Blade by using the D9R production curve. Start at 90 m (300 ft) and read up to the D9R production line, then over to the left to determine its maximum hourly production of 612 metric tons (675 tons).

Since the graphs are based on a 890 kg/m^3 (1500 lb/yd^3) coal density, this production figure has to be adjusted to reflect lignite coal:

Coal density correction factor = 710/890 (1200/1500) = 0.8.

Obtain the production correction factor for the 5% adverse grade from the chart: 0.9.

The correction factor for the 50 minute hour is 50/60 = .83.

Now calculate the adjusted D9R hourly production using the correction factors:

Metric $612 \times .8 \times .9 \times .83 = 366$ tons/hour
English $675 \times .8 \times .9 \times .83 = 403$ tons/hour

The D9R falls in the required production range. For short periods of peak power capacity, production could be increased by slot dozing.

Production for the D10R, 824G and 834B can be calculated using the same method.

D10R

Metric $850 \times .8 \times .9 \times .83 = 508$ tons/hour
English $935 \times .8 \times .9 \times .83 = 559$ tons/hour

824G

Metric $400 \times .8 \times .9 \times .83 = 239$ tons/hour
English $440 \times .8 \times .9 \times .83 = 263$ tons/hour

834B

Metric $689 \times .8 \times .9 \times .83 = 412$ tons/hour
English $760 \times .8 \times .9 \times .83 = 454$ tons/hour

Therefore, the D9R or 834B could most economically satisfy the production requirements.

Notes —

LAND CLEARING

CONTENTS

Land clearing must be treated more as an art than a science because production rates and methods vary greatly from one area to another. This section deals with the many variables in clearing and includes methods, equipment and procedures to determine productivity rates.

VARIABLES AFFECTING CLEARING OPERATIONS

Vegetative Growth — Factors affecting production and therefore cost, include the number of trees, size of trees, wood density, root systems, vines and undergrowth. These factors can be estimated by a "tree-count" as discussed under "Job Survey."

End Use of Land — Since different end uses require different degrees of clearing (i.e. highways, dams, tree crops, row crops, etc.), this is one of the most important factors to consider in choosing the proper clearing method and equipment.

Soil Conditions or Bearing Capacity — Factors affecting clearing operations include topsoil depth, soil type, moisture content, and the presence of rocks and stones.

Topography — Grade and terrain factors such as steep slopes, ditches, swampy areas, boulders and even ant hills greatly affect the normal operation of some equipment.

Rainfall and Climate — Usually all phases of land clearing from cutting to burning are concerned to some degree with temperature changes and the amount of rainfall during the clearing operation.

Job Specifications — Specifications dictate the degree of clearing to be done, area size, completion dates, method of debris disposal, soil conservation and other factors which affect method and equipment selection.

JOB SURVEYS

Knowledge of rainfall and climate, end use of the land, and job specifications can be obtained from records, surveys, engineering studies, and written specifications. You should personally review the land to be cleared to gain other necessary and valuable information.

The survey should include a study of general topography and soil conditions. Note such problem factors as hills, rocks, or swamps which would significantly affect production or which would require special treatment.

Cruise the area to be cleared and determine the acreage of each vegetative type (i.e. upland woods, low timberlands, swamps). Make at least three tree counts at random for each vegetation type. To conduct these counts, randomly locate two points 100 meters (328 feet) apart. Count and measure vegetative growth along a straight line between these points for a width of about 5 meters (16 feet) on both sides. This gives the population of 1/10 hectare (1/4 acre).
NOTE:

1. Density of vegetation less than 30 cm (12 in) diameter
   Dense — 1480 trees/hectare or more (600 trees/acre)
   Medium — 990-1480 trees/hectare (400-600 trees/acre)
   Light — less than 990 trees/hectare (400 trees/acre)
2. Presence of hardwoods expressed in percent
3. Presence of heavy vines
4. Average number of trees per hectare (2.47 acres) in each of the following ground level diameter size ranges:
   Less than 30 cm (1 ft)
   31 cm-60 cm (1-2 ft)
   61 cm-90 cm (2-3 ft)
   91 cm-120 cm (3-4 ft)
   121 cm-180 cm (4-6 ft)
5. Sum of diameter of all trees per hectare (2.47 acres) above 180 cm (6 ft) in diameter at ground level.

CLEARING METHODS AND EQUIPMENT

Methods for Initial Felling — There are several methods indicating the degree of clearing for initial felling and several types of equipment for use with each method. Equipment use in different size vegetation and different size areas is summarized in the table on the next page. This information should serve only as a rough guideline in selecting equipment. The economical land area for each type of equipment will vary with the capital cost of equipment and moving cost. It is also affected by whether there are alternate uses for equipment such as using tractors for other construction work or tillage.

Land Clearing Machines — Job size, severity of job such as tree size, and time limit to complete will influence machine selection. Some machines, such as the D6R, D7R and D8R are more suited for this type work than others, but imagination and resourcefulness can allow the use of other types of machines in specific applications. For example, loaders are used more today in raking and piling operations than ever before.

Operator Protection and Machine Guarding — Daily production has been estimated to increase 20% when cab guards are used. Cabs designed specifically for clearing are available from Rome and other auxiliary equipment manufacturers.

The radiator, engine, and underside of the tractor must be well protected. Perforated hoods, screens, crankcase guards and hydraulic cylinder guards are generally recommended.

Generally speaking, lower cost clearing can be done with larger tractors if the amount of clearing involved is sufficient to merit the initial investment in the bigger machine. Because most clearing work requires frequent direction changes, a power shift transmission should be standard equipment. The direct drive transmission tractor is recommended when the tractor is used principally in constant drawbar work such as chaining or pulling a disc harrow. In most applications, a winch should also be considered on one of every three tractors in a fleet.

EQUIPMENT SELECTION TABLE

	UPROOTING	CUTTING AT OR ABOVE GROUND LEVEL	KNOCKING TO THE GROUND	INCORPORATING INTO THE SOIL
LIGHT CLEARING — Vegetation up to 5 cm (2 in) diameter				
Small areas 4 hectares (10 acres)	Bulldozer blade, axes, grub hoes and mattocks	Axes, machetes, brush hooks, grub hoes and mattocks, wheel-mounted circular saws	Bulldozer blade	Moldboard plows, disc plows, disc harrows
Medium areas 40 hectares (100 acres)	Bulldozer blade	Heavy duty sickle mowers [up to 3.7 cm (1½ in) diameter] tractor-mounted circular saws, suspended rotary mowers	Bulldozer blade, rotary mowers; flail-type rotary cutters; rolling brush cutters	Moldboard plows; disc plows, disc harrows
Large areas 400 hectares (1000 acres)	Bulldozer blade, root rake, grubber, root plow, anchor chain drawn between two crawler tractors; rails	—	Rolling brush cutter; flail-type cutter; anchor chain drawn between two crawler tractors; rails	Undercutter with disc; moldboard plows; disc plows; disc harrows
INTERMEDIATE CLEARING — Vegetation 5 to 20 cm (2 to 8 in) diameter				
Small areas 4 hectares (10 acres)	Bulldozer blade	Axes, crosscut saws, power chain saws, wheel-mounted circular saws	Bulldozer blade	Heavy-duty disc plow; disc harrow
Medium areas 40 hectares (100 acres)	Bulldozer blade	Power chain saws, tractor-mounted circular saws, single scissor type tree shears	Bulldozer blade, rolling brush cutter [up to 12 cm (5 in) diameter], rotary mower [up to 10 cm (4 in) diameter]	Heavy-duty disc plow; disc harrow
Large areas 400 hectares (1000 acres)	Shearing blade, angling (tilted) bulldozer blade, rakes, anchor chain drawn between two crawler tractors, root plow	Shearing blade (angling or V-type)	Bulldozer blade, flail-type rotary cutter, anchor chain	Bulldozer blade with duty harrow
LARGE CLEARING — Vegetation 20 cm (8 in) diameter or larger				
Small areas 4 hectares (10 acres)	Bulldozer blade	Axes, crosscut saws, power chain saws	Bulldozer blade	—
Medium areas 40 hectares (100 acres)	Shearing blade, angling (tilted), knockdown beam, rakes, tree stumper	Shearing blade (angling or V-type), tree shear [up to 70 cm (26 in) softwood; 35 cm (14 in) hardwood], shearing blade — power saw combination	Bulldozer blade	—
Large areas 400 hectares (1000 acres)	Shearing blade, angling (tilted), tree pusher, rakes, tree stumper, anchor chain with ball drawn between two crawler tractors	Shearing blade (angling or V-type), shearing blade — power saw combination	Anchor chain with ball drawn between two crawler tractors. [Use dozer blade for trees over 18 cm (7 in).]	—

NOTE: The most economical size area for each type of equipment will vary with the relative cost of capital equipment versus labor. It is also affected by whether there are alternate uses for equipment such as using tractors for tillage.

PRODUCTION ESTIMATING

GENERAL — CONSTANT SPEED OPERATIONS

Production is the hourly clearing rate usually expressed in hectares or acres.

For many land clearing operations, production is calculated by multiplying the tractor speed by the width of cut and converting to hectares or acres per hour.

Metric system:

The base formula is:

$$\frac{\text{Width of cut (meters)} \times \text{speed (km/h)}}{10} = \text{hectares/h}$$

When an efficiency of 82.5% is used, the formula becomes:

$$\frac{\text{Width of cut (m)} \times \text{speed (km/h)} \times .825}{10} = \text{hectares/h}$$

English measure:

$$\frac{\text{Width of cut (ft)} \times \text{speed (mph)}}{43{,}560\ (\text{ft}^2)} = \text{acres/hr}$$

The American Society of Agricultural Engineers formula for estimating hourly production of a constant speed operation is based on 82.5% efficiency. With this efficiency, the formula becomes:

$$\frac{\text{Width of cut (ft)} \times \text{speed (mph)} \times .825}{43{,}560\ (\text{ft}^2)} = \text{acres/hr}$$

Width of cut is the effective working width of the equipment and may not be the same as its rated width. Working width should be measured on the job but can be estimated when necessary.

The actual machine speed can be determined by measuring the amount of time to travel a given distance. When using the metric system, the time to travel 16.7 meters or a multiple thereof, can be converted into kilometers per hour.

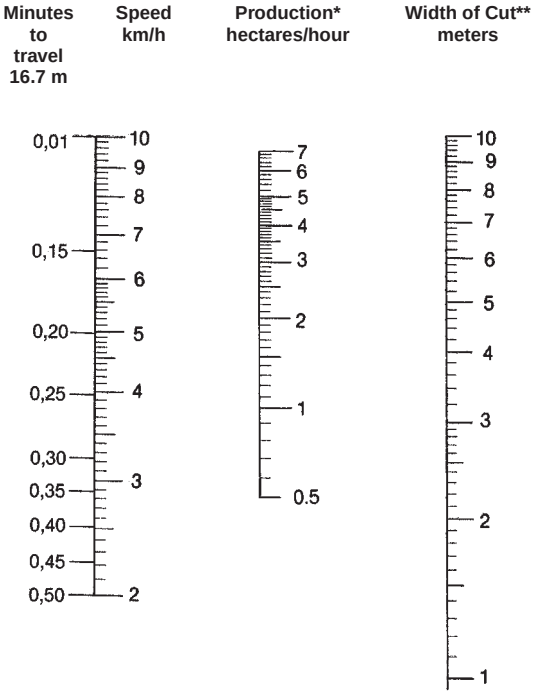
$$\frac{1.0}{\text{(Time in min. to travel 16.7 meters)}} = \text{speed (km/h)}$$

Since 88 ft/min. equals one mph, the lapsed time to travel 88 ft, or a multiple of 88 ft, can easily be converted into miles per hour.

$$\frac{1.0}{\text{(Time in min. to travel 88 ft)}} = \text{speed (mph)}$$

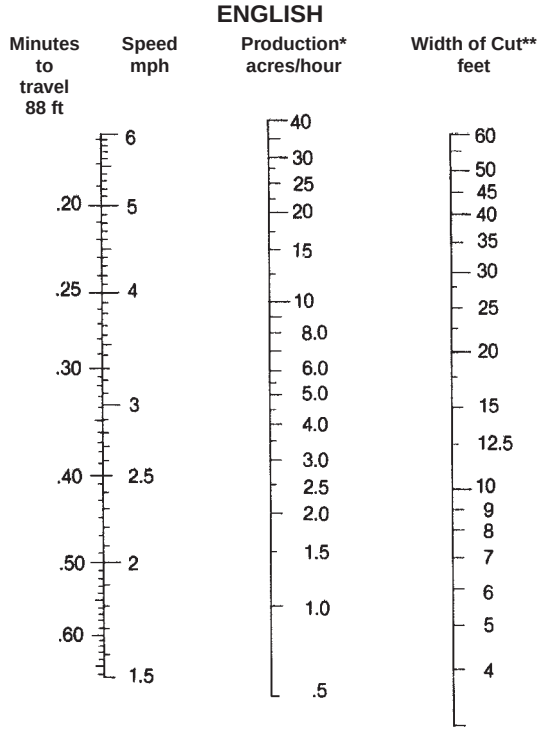
The following nomographs in both the Metric and English systems convert speed and width of cut directly into acres or hectares per hour at 82.5% efficiency without the need for calculations.

METRIC



*Based on 82.5% efficiency.

**When width of cut exceeds 10 meters, use a multiple of the width of cut and increase production proportionately.



*Based on 82.5% efficiency.
**When width of cut exceeds 60 feet, use a multiple of the width of cut and increase production proportionately.

CUTTING PRODUCTION ESTIMATING

Most land clearing operations such as bulldozing, cutting, grubbing, raking and piling are not performed at constant speed. Because off-the-job production is difficult to estimate for these operations, Rome Industries has developed formulas for estimating cutting and piling time. These formulas take into consideration variable prime mover speeds through a factor, "B", the base time for each tractor to cover one hectare (2.47 acres) of light material.

To estimate **tractor cutting time per hectare** (2.47 acres) on a specific land clearing job, apply the factors shown in the following table, together with data obtained from the job survey, in the formula:

$T = X\ [A(B)+M_1N_1+M_2N_2+M_3N_3+M_4N_4+DF]$ where

T = Time per hectare (2.47 acres) in minutes
X = Hardwood or density factor affecting total time
A = Density or vine presence factor affecting base time
B = Base time for each tractor per hectare (2.47 acres)
M= Minutes per tree in each diameter range
N = Number of trees per hectare (2.47 acres) in each diameter range obtained from field survey
D = Sum of diameter in 30 cm (1 ft) increments of all trees per hectare (2.47 acres) above 180 cm (6 ft) in diameter at ground level obtained from field survey
F = Minutes per 30 cm (1 ft) of diameter for trees above 180 cm (6 ft) in diameter.

Hardwoods affect over-all or total time as follows:

75-100% hardwoods: Add 30% to total time (X=1.3)
25-75% hardwoods: No change (X=1.0)
0-25% hardwoods: Subtract 30% from total time (X=0.7)

Production Factors for Felling with Rome K/G Blades

Tractor	Base Minutes per hectare (2.47 acres) "B"	Diameter Range				Dia. above 180 cm per 30 cm (6' per foot) "F"
		30-60 cm (1-2 ft) "M_1"	60-90 cm (2-3 ft) "M_2"	90-120 cm (3-4 ft) "M_3"	120-180 cm (4-6 ft) "M_4"	
165 hp	85	0.7	3.4	6.8	—	—
230 hp	58	0.5	1.7	3.3	10.2	3.3
305 hp	45	0.2	1.3	2.2	6	1.8
405 hp	39	0.1	0.4	1.3	3	1.0

Explanation of columns in table:

Tractor — Based on current model tractors (power shift when applicable) working on reasonably level terrain (below 10% grade) with good footing, no stones, average mixture of soft and hard woods. Tractor is in proper operating condition, blade is sharp, and properly adjusted.

Base Minutes — The base figures represent the number of minutes required for each tractor to cover a hectare (2.47 acres) of light material where no trees require splitting or other individual treatment. Time required is affected by the density of material less than 30 cm (1 ft) in diameter and the presence of vines.

a. dense — 1480 trees/hectare (600 or more trees/acre): Add 100% to base time (A=2.0)
b. medium — 990-1480 trees/hectare (400-600 trees/acre): No change (A=1.0)
c. light — less than 990 trees/hectare (400 trees/acre): Subtract 30% from total time (A=0.7)

Presence of heavy vines: Add 100% to base time (A=2.0). *Very* heavy vines add 300% to base time. (A=3.0)

Dia. Range — M_1 represents minutes required to cut trees from 31-60 cm (1-2 ft) in diameter at ground level.

M_2 same for trees 61-90 cm (2-3 ft) diameter.

M_3 same for trees 91-120 cm (3-4 ft) diameter.

M_4 same for trees 121-180 cm (4-6 ft) diameter.

For Dia. above 180 cm (6 ft) — The figures in this column represent size the number of minutes required per 30 cm (1 ft) of diameter for each tractor to cut trees above 180 cm (6 ft) in diameter. Thus, to fell a 240 cm (8 ft) diameter tree would require 8×1.8 or approximately 14.4 minutes with a D8R.

Example problem:

Calculate the felling production of a D8R with K/G Blade in these conditions: reasonably level terrain, firm ground, well drained, 85% hardwoods with heavy vines and the following average tree count per hectare (2.47 acre):

Diameter Range	Less than 30 cm (1 ft) "B"	31-60 cm (1-2 ft) "N_1"	61-90 cm (2-3 ft) "N_2"	91-120 cm (3-4 ft) "N_3"	121-180 cm (4-6 ft) "N_4"	Sum Dia's Above 180 cm (6 ft) "D"
Number of Trees	1100	35	6	6	4	488 cm (16 ft)

Solution:

$T = X\ [A(B)+M_1N_1+M_2N_2+M_3N_3+M_4N_4+DF]$

$T = 1.3\ [2.0\ (45)+0.2\ (35)+1.3\ (6)+2.2\ (6)+6\ (4)+16\ (1.8)]$

$= 1.3\ (90+7+7.8+13.2+24+28.8)$

$= 1.3\ (170.8)$

$= 222$ minutes/hectare (90 min/acre)

● ● ●

Where the job requires grubbing trees and stumps greater than 30 cm (1 ft) in diameter at the same time the trees are sheared, use the same basic procedure as defined above including the variables for the presence of hardwoods. After time per hectare (acre) in minutes has been determined, increase the over-all or total time by 25%.

Where the job requires re-entering the area (after all trees have been sheared) to remove stumps with a tilted shearing blade or stumper, increase the total time by 50%.

PILING PRODUCTION ESTIMATING

A procedure has also been developed for estimating piling production for a tractor equipped with a K/G blade or rake.

To estimate tractor hours per hectare (acre) on a specific land clearing job, apply the factors shown in the following table with data obtained from the job survey, in the formula:

$T = B+M_1N_1+M_2N_2+M_3N_3+M_4N_4+DF$

where

T = Time per hectare (2.47 acre) in minutes.

B = Base time for each tractor per hectare (2.47 acre).

M = Minutes per tree in each diameter range.

N = Number of trees per hectare (2.47 acre) in each diameter range obtained from field cruise.

D = Sum of diameter in 30 cm (1 ft) increments of all trees per hectare (2.47 acre) above 180 cm (6 ft) in diameter at ground level obtained from field cruise.

F = Minutes per 30 cm (1 ft) of diameter for trees above 180 cm (6 ft) in diameter.

Production Factors for Piling in Windrows*

Tractor	Base Minutes per hectare (2.47 acres) "B"	Diameter Range				Dia. above 180 cm per 30 cm (6' per foot) "F"
		30-60 cm (1-2 ft) "M_1"	60-90 cm (2-3 ft) "M_2"	90-120 cm (3-4 ft) "M_3"	120-180 cm (4-6 ft) "M_4"	
165 hp	157	0.5	1.0	4.2	—	—
230 hp	125	0.4	0.7	2.5	5.0	—
305 hp	111	0.1	0.5	1.8	3.6	0.9
405 hp	97	0.08	0.1	1.2	2.1	0.3

*May be used with most types of raking tools and angled shearing blade. Windrows to be spaced approximately 61 meters **(200 feet)** apart.

Explanation of columns in table:

Tractor — Production with tractor working alone based on current model tractors (power shift when applicable) working on reasonably level (below 10% grade) terrain with good footing, no stones, average mixture of soft and hard woods. The tractor is in proper operating condition. Decrease total time by 25-50% depending on the number and size of trees when using three or more tractors in combination.

Base Minutes — The base figures represent the number of minutes required for each tractor to cover a hectare (2.47 acres) of light material.

Dia. Range — M_1 represents minutes required to pile trees from 31-60 cm (1-2 ft) diameter at ground level.

M_2 same for trees 61-90 cm (2-3 ft) diameter.

M_3 same for trees 91-120 cm (3-4 ft) diameter.

M_4 same for trees 121-180 cm (4-6 ft) diameter.

For Dia. above 180 cm (6 ft) — The figures in this column represent for each tractor size the number of minutes required per 30 cm (1 ft) of diameter to pile trees above 180 cm (6 ft) in diameter. Thus, to pile a 240 cm (8 ft) diameter tree would require 8×0.9 or approximately 7.2 minutes with a D8R tractor.

Where the job requires piling of grubbed trees and stumps greater than 30 cm (1 ft) in diameter, use the same basic procedure defined above and then increase over-all or total time by 25%.

In dense small diameter brush with few or no large trees, or when cutting is vine entangled, reduce the base time by 30%.

Example problem:

Calculate the windrow piling production of a D7R Series II with Rake in level terrain, no grubbing, and average mixture of hardwoods and softwoods where the average tree count per hectare (2.47 acres) is:

Diameter Range	Less than 30 cm (1 ft) "B"	31-60 cm (1-2 ft) "N_1"	61-90 cm (2-3 ft) "N_2"	91-120 cm (3-4 ft) "N_3"	121-180 cm (4-6 ft) "N_4"	Sum Dia's Above 180 cm (6 ft) "D"
Number of Trees	1100	35	6	6	2	0

Solution:

$T = B+M_1N_1+M_2N_2+M_3N_3+M_4N_4+DF$

$= 125+0.4\ (35)+0.6\ (6)+2.5\ (6)+5.0\ (2)+[DF=0]$

$= 42.6$

$= 177.6$ minutes/hectare (72 min/acre)

●●●

To find the number of machines required for each operation, use the formula:

Hr/hectare (acre) × number of hectares (acres) = number of machines needed*

*Average machine production for all operation in hr/hectare (acre).

To cost estimate each method or phase of operation, use this calculation:

Owning and Operating cost/hr × hr/hectare (acre) × number of hectares (acres) = cost

Because of the many variables that increase or decrease production, these formulas should be considered only as guidelines in arriving at a rough production estimate. This estimate should be tempered by personal judgment based on past experience and personal knowledge of the area.

WASTE DISPOSAL

CONTENTS

INTRODUCTION

An increasing volume of refuse is generated by every person, commercial entity and household day after day ... 365 days a year. Disposal of this waste is a major problem worldwide. Increased governmental legislation designed to protect the environment and rising transportation and land acquisition costs have made waste disposal a significant user of earthmoving and specialty mobile equipment.

The most commonly accepted disposal method is burying refuse in a sanitary landfill. A sanitary landfill protects the environment by disposing solid waste on land in an engineered cell. Building a cell involves spreading the waste in thin layers, compacting it to the smallest practical volume, covering it with soil by the end of each working day, and compacting the cover material. Proper equipment selection and operating technique can maximize refuse and cover compaction and extend the operational landfill life.

LANDFILL METHODS

There are three basic landfill methods:

In the *area* method, waste is usually deposited at the toe of the previously compacted cell and then spread and compacted. This method is attractive for landfills receiving over 450 metric tons (500 tons) of refuse per day because it reduces truck unloading congestion. Cover material is normally handled by articulated trucks or wheel tractor-scrapers from nearby borrow sites.

The *trench* method is normally found at smaller landfills where the ground water table is deep. A trench is excavated and refuse is deposited and compacted within it. Excavated material becomes the cover material. Since the trench working face is narrow, truck congestion can occur. This method is usually attractive to landfills receiving under 450 metric tons (500 tons) of refuse per day.

The *ramp* method combines the characteristics of both area and trench designs. Refuse is dumped, spread and compacted on existing slopes and covered with material excavated directly in front of the working face. The excavated area becomes part of the next cell. This is a good way for a landfill to begin operation with a minimum of equipment expenditures.

EQUIPMENT SELECTION

A landfill's largest single cost for daily operation is purchasing, operating and maintaining the mobile equipment. Undersized, inadequate or unreliable equipment results in breakdowns, higher operating costs and improper landfill operation.

Landfill equipment performs three distinct functions:

1. Waste handling and compaction equipment dispose of the waste. Track-type tractors, track loaders, and steel-wheeled landfill compactors are the primary machines.
2. Cover material handling machines provide daily cover requirements. If supplying cover material is a machine's sole function at a landfill, it can be selected on the basis of normal earthmoving considerations, such as material characteristics, distance to borrow areas, volume to be transported, and other basic earthmoving principles, i.e., maximizing earth movement in the least amount of time at the lowest cost per yard.
3. Support equipment includes motor graders, backhoe loaders, hydraulic excavators, water trucks, air compressors, service vehicles, water pumps, generators and any other necessary equipment.

Track-Type Tractors

The track-type tractor is the most popular and versatile machine on a sanitary landfill. They not only spread and compact refuse and cover material, they also prepare the site, rip cover material, build haul roads, knock down trees, remove stumps, and work in virtually all weather conditions. They are well-suited for all three landfill methods (area, ramp, and trench).

The crawler tractor can achieve compaction densities of 475 to 590 kg/m^3 (800-1000 lb/yd^3). Maximum compaction is achieved when it works on a 3:1 slope, permitting the grousers to rip and tear while pushing and compacting waste up-slope. Economic limit of cover or waste movement by a track-type tractor is normally under 90 m (300 ft).

Track Loaders

Track loaders are highly versatile allowing them to perform many applications. Small landfills under 135 metric tons (150 tons) per day generally utilize a minimum amount of equipment. Track loaders can serve both the waste handling and cover material functions.

The track loader is an ideal machine for the trench method. Since the bucket does not extend outside the tracks, it can obtain full compaction to the trench walls. Rippers can be attached to handle frozen cover material. Compaction densities are similar to or slightly higher than the track-type tractor — 475 to 590 kg/m^3 (800-1000 lb/yd^3). Many people believe track loaders equipped with single grouser shoes provide maximum demolition and compaction densities. Loading the bucket during compaction passes increases weight helping achieve higher densities.

Equipping track loaders with multi-purpose buckets increases their versatility in single machine applications, allowing the operator to selectively grapple items out of the working face.

Track loaders are also ideal for transfer stations. The machine's weight compacts the trash reducing volume and increases density. Wider and larger capacity buckets from Balderson Special Attachments are needed to fully utilize the capabilities of the track loader in this application.

Landfill Compactors (Steel-Wheeled)

Landfill compactors are specialized pieces of equipment effective in spreading and compacting large volumes of waste. Compactors offer higher operational speeds than track machines. This is the recommended machine if more than one spreading and compaction machine is needed and waste does not have to be pushed more than 90 m (300 ft).

Landfill compactors over 20 410 kg (45,000 lb) operating weight achieve the highest compaction levels — from 710 to 950 kg/m^3 (1200-1600 lb/yd^3).

Landfill compactors normally operate on slopes no steeper than 4:1 due to reduced compaction and operational safety. Compactors should not be used to excavate cover material.

Wheel Loaders

Although not recommended as a waste handling and compaction machine, wheel loaders are used by those communities sharing a single machine which travels from landfill to landfill. Versatility and mobility are the primary wheel loader advantages. In landfills over 272 metric tons (300 tons) per day, wheel loaders will sometimes be used to perform general clean-up tasks. Wheel loaders are also popular in transfer stations to load and separate refuse. Special foam-filled tires should be considered due to the constant threat of tire puncture. However, foam filled tires will have reduced ton-mile-per hour capabilities.

Wheel loaders can achieve compaction densities of 530 to 650 kg/m^3 (900-1100 lb/yd^3). A disadvantage of wheel loaders is that they can leave ruts in the refuse, requiring extra cover material.

Wheel Tractor-Scrapers

A scraper can be used to excavate trenches for site preparation, but usually performs a cover operation at a landfill and is most economical at distances over 185 m (600 ft). A scraper should be selected as if it were performing a typical earthmoving job.

Preferably, the scraper unloads the cover material close to the working face, either at the base or top. The cover material is then spread by the machine(s) working on the refuse. This reduces the possibility of tire damage from driving over the refuse. Foam filled tires are not recommended for scrapers due to the high travel speeds. Since excavating and transporting cover material is a major expense at a landfill, scrapers with work alone capability have been the most popular.

Articulated Trucks

Articulated trucks are versatile, highly maneuverable, all-weather haulers that can negotiate poor underfoot conditions and tight spaces normally found in landfills. In combination with a variety of loading tools, articulated trucks typically work in site preparation, cell construction, hauling cover material, and are economically effective at haul distances ranging from 0.1 km-5 km (600 ft-3 miles). In dump configuration, cover material can be dumped close to the face and spread by other machines. In ejector configuration, articulated trucks provide on-the-go dumping and can operate in soft material and on side-slopes that would not be suitable for machines in dump configuration. In addition, Cat articulated trucks are available in a range of container handler and refuse body configurations for specialized landfill applications.

Machine Selection Factors

Selecting the type, size, quantity, and combination of machines required to spread, compact, and cover varying daily refuse volumes is determined by the following parameters:

1. Amount and type of waste to be handled (daily tonnage)
2. Amount and type of soil cover to be handled
3. Distance cover material to be transported
4. Weather conditions
5. Compaction requirements
6. Landfill method utilized
7. Supplemental tasks
8. Budget
9. Growth

A. *Daily tonnage and type of waste* — Amount of waste produced by a community is the major variable in selecting the appropriate size machine. The chart serves as a guideline in sizing a landfill machine. For example, if a community generates approximately 180 metric tons (200 tons) of refuse per day, a D6 or 963 and a 816 Landfill Compactor should be considered.

WASTE EQUIPMENT SELECTION BASED UPON POPULATION AND DAILY REFUSE TONNAGE

Population	Metric Tons/ Day	U.S. Tons/ Day	Machine(s)Required
0-20,000	0-45	**0-50**	D3 or 933
20,000-60,000	45-136	**50-150**	D4 or 939 and an 816
60,000-100,000	136-226	**150-250**	D5 or D6 or 953 and 816
100,000-140,000	226-317	**250-350**	D6 or D7 or 963 and 816
140,000-200,000	317-453	**350-500**	D7 or D8 or 973 and 816
200,000-300,000	453-680	**500-750**	D8 or D9 and 826
300,000-more	680-more	**750-more**	D9, D10 and 836/variety of support equipment

NOTE: Daily tonnage figures are based on 2.26 kg **(5 lb)** of residential refuse per person per day. The amount of waste/person/day can vary depending on the community and should be adjusted to the individual community.

Type of waste to be handled will strongly influence machine selection. The major solid waste components for a community should be identified and the proper machine chosen based on the type of waste and the compaction desired. For example, if the site receives a high proportion of noncompactible heavy industrial waste (rocks, bricks, concrete, reinforcing rod, etc.) a compactor might not achieve normal compaction densities and the pushing and tractive ability of a track-type tractor may be needed. However, a small track-type tractor has more difficulty compacting bulk waste such as washing machines and telephone poles than a landfill compactor.

Waste varies from location to location, even within a community; however, the following figures are representative in the U.S.:

Characterization of Domestic — Household Waste

Component	Percent by Weight
Paper	42
Food	16
Glass	14
Metal	12
Plastics	5
Wood	5
Rubber and Leather	4
Textiles	2

NOTE: Moisture content can have a significant effect on weight characteristics. Field tests have indicated moisture content can vary from 10-80% during dry and wet seasons.

B. *Amount and type of cover material to be handled* — Although landfill size and type will vary, a rule of thumb for estimating needed cover material is one cubic meter (cubic yard) of cover material for every four cubic meters (or cubic yards) of in-place compacted waste. That is, about 20-25% of a sanitary landfill's volume consists of soil used for cover (including daily and final covering). On smaller landfills, the percentage of soil could be as high as 50% to meet reasonable cover requirements.

It is important to remember that cover material also occupies landfill space reducing the volume available for refuse. For example a landfill with 1 900 000 m^3 (2,500,000 yd^3) of *total volume* would provide for disposing of 1 520 000 m^3 (2,000,000 yd^3) of refuse and allow 380 000 m^3 (500,000 yd^3) of cover material. This example considers one cubic yard of cover for every 4 cubic yards of in place compacted waste.

The type of cover material can also be important. If the material is sandy or highly abrasive, a rubber tired wheel loader or scraper might be considered rather than a track-type unit.

C. *Distance cover material is to be transported* will have a large effect on cover equipment selection. The following economic limits or guidelines are recommended for cover material movement. The quantity of material to be moved and the time available must be considered when using these guidelines.

Track-type tractor	0-90 m	(0-300 ft)
Track loader	0-152 m	(0-500 ft)
Wheel loader	0-185 m	(0-600 ft)
Wheel tractor-scraper	over 185 m	(over 600 ft)
Articulated trucks	over 185 m	(over 600 ft)

D. *Weather conditions* — when working in inclement weather, the tractive capability of a track-type machine may be necessary for poor underfoot conditions or to rip frozen cover material.

E. *Compaction requirements* — are becoming critical as extended landfill life is sought. If high density is desired, then a compactor may be necessary.

The following pages contain features, specifications and work tools for Caterpillar's Waste Handling machines. Additional information regarding drawbar pull/rimpull Vs groundspeed, controls, ground pressures, production estimating for these machines as well as specifications and performance information for Wheel Tractor Scrapers and Articulated Trucks can be found in their respective Performance Handbook sections.

Features:

- **Hinged heavy duty radiator** doors are guarded to prevent excessive trash build-up. Quick release handles allow easy access for cleaning.
- **Final drive, pivot shaft, and idler seal guarding** helps prevent wire, cable and similar material from winding around components and damaging seals.
- **Striker bars for front, rear and ripper** (all optional) keep trash from damaging fenders, fuel and hydraulic tanks or other sheet metal.
- **Lighting protection.** Front lights are mounted on top of bulldozer lift cylinders. Rear lights are ROPS mounted.
- **AMOCS Waste Handling Arrangement** radiator with 6 fins/inch (optional on D6R thru D9R).
- **Flexxaire fan** is recommended option for D6R thru D10R.
- **Elevated sprocket** removes final drives from wear environment and eliminates impact loading for extended power train life.
- **Sheet metal guarding** near track and on dozer tilt hoses.
- **Fuel tank guards** keep trash from damaging fuel and hydraulic tanks or other sheet metal.
- **Heavy duty steps and grab handles** resist damage from landfill debris.
- **Trapezoidal-shaped center hole track shoes (optional)** help keep track clean during machine operation.
- **Blade trash racks (optional)** prevent blade spillover and damage to cylinders or radiator guard.
- **75 amp alternator available on D6R, D7R, D8R, D9R, 100 amp on D10R** insures adequate current is available to maintain battery and operate accessories.
- **Elevated prescreener** to remove engine air inlet from debris environment. Larger surface area to resist plugging. Turbine precleaner is optional.
- **Cat turbine precleaner** removes large particulates from incoming air before they reach the air filter, helps extend filter life. (Optional on D6R-D10R.)
- **ROPS mounted air conditioning** helps prevent condenser core plugging. Provides full utilization of jacket water cooling system by avoiding additional heat load from radiator mounted condenser.
- **Laminated thermal shields** cover the exhaust stack inside the engine compartment, hot-side of the turbocharger, and the exhaust manifold. These shields reduce surface temperatures well below the flash point of most common combustibles encountered. (Optional on D6-D8. Standard on D9R.)
- **Chassis Guards.**
- **Sealed belly guards**.
- **Perforated engine enclosures** standard on D10R and required attachments on D6R thru D9R.
- **Carrier rollers** not recommended.

*Blade capacities, weights and heights include 762 mm **(2'6")** trash rack on D8R blades, 914 mm **(3'0")** trash rack on D9R blades, and 1067 mm **(3'6")** trash rack on D10R blades.
**Total bulldozer arrangement includes blade with trash rack, pusharms, braces, cylinders, lines, trunnions and lift cylinder mountings.

Features:

- **Unmatched versatility** — excavates, loads, carries, covers, dozes, spreads, compacts, shreds, sorts, grapples — a true all purpose machine. Performs well as a one-machine fleet, a support machine or an all-around backup unit.
- **Demolition applications** — The Waste Handling Arrangement (963C and 973C Waste Demolition Specials) can also be used in demolition or demolition transfer stations when properly equipped with the extra guarding required for this severe environment.
- **Special guard package** protects the final drive seals, pivot shafts and idlers from debris that can wrap around and damage these components.
- **Raised precleaner** with prescreener to prevent airborne debris from clogging engine air intake.
- **Additional heavy duty guarding** helps protect sheet metal and machine components from damage in waste handling applications.
- **Improved serviceability** — swing open doors, guards and air coolers give quick access for cleaning debris and servicing.
- **Hinged, heavy duty radiator guard** with quick release "T" handles allows for easy access to clean the radiator.
- **Debris Barrier Package** protects machine from material entering engine and other compartments.
- **Lamp guard group** protects front and rear lamps with bolt on grids.
- **Optional rear striker bars** keep trash from climbing the track and damaging fenders.
- **Optional final drive abrasion guards** are available in two-piece or four-piece sections to protect the final drive case from premature wear from abrasion or gouging.
- **Optional single grouser, trapezoidal-shaped center hole track shoes** provide maximum traction. The center holes allow sprocket to punch out dirt and debris, best choice for landfill applications.
- **Optional chopper shoe track** uses cast shoes with extreme service single and diagonal grousers that chop and shred material as the machine moves and turns. Very effective for waste or demolition stations.
- **Flexxaire engine cooling fan** (optional on 973C) manually or automatically changes direction to purge accumulated debris from the radiator.

Weight (approx.)	1615 kg	**3565 lb**	2109 kg	**4650 lb**	2765 kg	**6100 lb**

*Standard GP or MP buckets with added trash rack also available.

Landfill Compactors Features:

- **Choice of Chopper Blades or PLUS TIPS** … Chopper blades alternate in a staggered-chevron design for maximum coverage and density. PLUS TIPS are standard on 836G — optional on 816F and 826G.
- **Cat designed and manufactured power train** … for optimum match, performance and efficiency. Responsive Cat diesel Engine. Single-lever planetary power shift. All-wheel drive.
- **Center-point articulation** … excellent maneuverability. Front and rear drums track, so material is chopped and compacted twice each pass.
- **Protective guarding** … helps keep trash from damaging machine components.
- **Caterpillar landfill blades** spread refuse and cover material … built strong to handle the wide range of refuse encountered in landfills.
- **Operator comfort and convenience** … sound suppressed cab with pressurized and filtered air circulation system. Adjustable suspension seat. Electronic Monitoring System and gauge package is standard. Optional air conditioner available.
- **Striker bars** … standard on 826G, 836 and 816F, prevents refuse from being carried over the rear wheels.

Features:

Caterpillar Waste Handling Wheel Loaders are equipped with the features and protection required in a demanding waste handling environment. These Caterpillar designed and built machines feature the following advantages:

- **Exceptional productivity** with fast cycle times for maximum production day-in day-out whether dozing, loading, stacking, or load and carry.
- **Protected work environment** enhances operator comfort, convenience and productivity.
- **Modified front frames** – (Standard on the 980G WHA) provide large cutouts that allows debris to fall out rather than packing and also provide easy access if cleaning is necessary.
- **Standard front drive guard and axle seal guards** (except 980G) protect from wire, string, strapping and other debris from wrapping and causing damage.
- **Front light guards** protect the lights from debris falling over the bucket spill plate.
- **Hinged crankcase and power train guards** help protect the engine and power train. The hinged design provides easy access for cleaning. (Powered guards available on some models.)
- **Standard waste application cooling system.** The improved, trash-resistant, multi-row module (IMRM) radiator, hood and engine enclosures work as a system to keep the radiator and engine compartment free of debris.
- **Trash resistant IMRM radiator** has six fins per inch (25.4 mm) and in-line tubes that resist plugging by allowing debris to pass through the core.
- **Hinged radiator prescreener** (966G & 972G) eliminates debris larger than what the radiator core will pass.
- **Hinged grill** (966G & 972G) allows access to hydraulic oil cooler and air conditioning condenser, which swing out for easy cleaning.

Recommended Waste Handling Options

- **Powered crankcase and power train guards** raise and lower at the flip of a switch allowing fast, easy and frequent cleanings.
- **High lift arrangement** increases bucket hinge pin height offering increased stacking and stockpiling capability. A critical feature when incoming volumes exceed conveyor capacity or floor space.
- **Traction control system (TCS)** option for 938G/IT38G provides maximum traction in slippery conditions. TCS electronically senses and limits wheel slip at each wheel independently.
- **Limited-slip differential** limits tire slip on both front and rear axles. Increases traction and reduces tire wear and scuffing in wet or dry conditions. Provides an alternative to the No SPIN differential which is not recommended due to increased tire wear, turning interference and poor tracking on dry surfaces.
- **Tire options:**
  L-5 bias hard rock lug
  L-5 slick
  RL-5K Goodyear radials
  XMINE Michelin radials (varies by model)
  Foam-filled
- **Hitch guards** help protect components in hitch area from damage.
- **Other guarding and options** are available. Contact your Caterpillar Dealer for information.

Work Tools

- **Refuse bucket** has excellent dozing and stockpiling capability. Large spill plate helps protect the machine from debris falling over the top of the bucket. Available in pin-on or quick coupler configurations.
- **Pallet forks** are ideal for handling refuse destined for further recycling or stacking refuse in landfills for covering.
- **Multi-purpose bucket** has the capability to clamp and sort large objects, doze cover material or other light dozing chores.
- **Quick coupler** increases versatility by allowing a single machine to utilize a wide variety of work tools in a host of applications.

REFUSE DENSITIES

Generally, loose residential and commercial refuse weighs 150-180 kg/m³ (250-300 lb/yd³). A refuse collection vehicle will increase this density to 237-415 kg/m³ (400-700 lb/yd³). In-place landfill density can vary from 355-890 kg/m³ (600-1500 lb/yd³), depending on the compactive effort applied to the refuse. Landfill sites that accept a high percentage of demolition waste can have densities up to 1485 kg/m³ (2500 lb/yd³). Cover material will generally raise fill densities 60-120 kg/m³ (100-200 lb/yd³) over the figures given above.

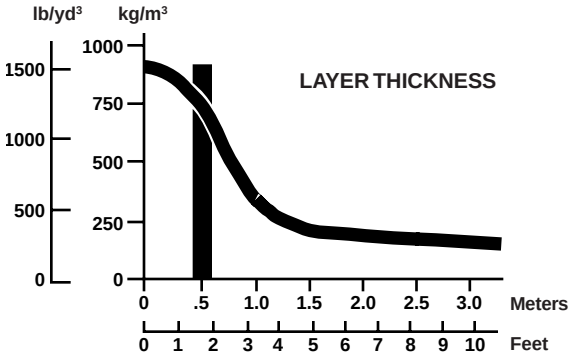
Weight of Refuse

	kg/m³	lb/yd³
Loose Refuse:	150-180	**250-300**
Packer Truck:	237-415	**400-700**
Fill Density:	355-890	**600-1500**
Refuse and Cover:	415-1009	**700-1700**

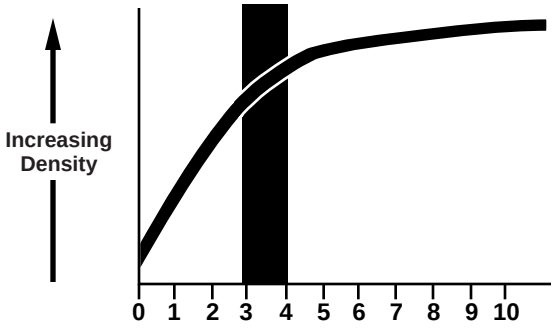
FACTORS GOVERNING COMPACTION

Assuming equal machine weight, regardless of the type of machine, the following factors (1-4) affect compaction:

1. Refuse Layer Thickness — The depth of each compacted layer is perhaps the single most important controllable factor influencing density. To obtain maximum density, waste should be spread and compacted in layers **not exceeding a depth of 610 mm (2 ft)**. Thicker layers will reduce the density that a machine can develop in a given number of passes. (Density figures shown do not include cover material.)



2. Number of passes made over the refuse also affects density. Regardless of the type of machine used, the unit should make 3-4 passes to achieve optimum density. The following graph illustrates that more than four passes result in little additional compactive effort. The added expense of additional passes is not justified by the incremental increase in density.



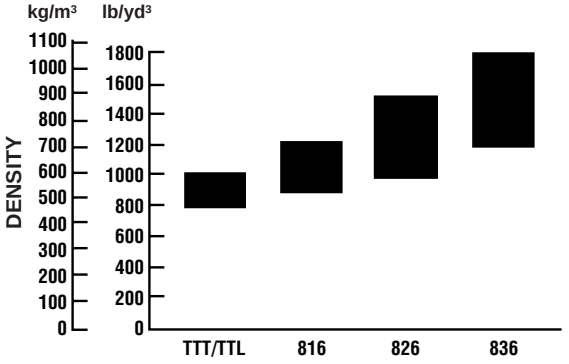
3. Slope — Maximum compactive effort by a track-type unit is achieved by working the waste on a slope of 3:1. Track-type machines achieve higher densities by grinding and shredding the refuse into smaller pieces as they climb a slope.

   Just the opposite is true for landfill compactors, the flatter the slope the better. This is because the weight of the landfill compactor is more efficiently utilized and concentrated when working on a flat surface. Landfill compactors that are used on slight slopes achieve a higher compaction density due to shearing stress that aids shredding and better blending of material.
4. Moisture Content — has been shown to have a significant effect on compacted density. It is believed that water tends to weaken the bridging characteristics of refuse, particularly paper such as large pieces of cardboard, etc., thereby allowing tighter consolidation. The water may also act as a lubricant — much as it does for soils. A minimum amount of moisture can increase refuse compaction density by 10%.

   The optimum moisture content for maximum compaction of household refuse appears to be around 50% by weight. Field tests show actual moisture contents varying from 10-80% during dry and wet seasons. Although higher moisture content can provide higher in-place densities, the chance of leachate formation also increases.

COMPACTION COMPARISON ESTIMATE

The following graph may be used as a rule of thumb for the compactive ranges of various types of landfill machines if proper operating technique is employed.



EXAMPLE OF INCREASED COMPACTION ON POTENTIAL LANDFILL LIFE

Landfill refuse capacity	1 530 000 m³ **(2,000,000 yd³)**
Operating days	260
Daily volume	365 metric tons **(400 tons)**
Yearly volume	94 328 metric tons **(104,000 tons)**

Compaction	Landfill Life	Gain
590 kg/m³ **1000 lb/yd³**	9.6 years	0
710 kg/m³ **1200 lb/yd³**	11.5 years	1.9 years
830 kg/m³ **1400 lb/yd³**	13.4 years	3.8 years
950 kg/m³ **1600 lb/yd³**	15.3 years	5.7 years
1070 kg/m³ **1800 lb/yd³**	17.2 years	7.6 years

In this example, each 120 kg (200 lb) increase in refuse density results in an additional 1.9 years of landfill life. Also this example is exclusive of cover requirements.

COMPACTOR PRODUCTION GUIDELINES

	Tons/Day		Tons/Hr	
Model	Metric	U.S.	Metric	U.S.
836	1016	1000	127	125
826G	813	800	102	100
816F	508	500	63.5	62.5

All models are pushing refuse 61 m **(200 ft)** spreading and making 3 to 4 passes to compact. A pass is defined as a machine traveling over refuse one time in one direction.

F. *Landfill method utilized* — impacts the equipment needed. The area method, which is generally suited for flat or gradual sloping surfaces will get maximum compaction effort with a compactor. The trench method may require a track loader due to its excavating and tractive capabilities.

G. *Supplemental tasks* — should be reviewed before selecting a landfill machine. Will the machine be required for site clearing, maintaining access roads, excavating, etc.? Auxiliary duties may require additional machine capability and/or attachments. If versatility is the key consideration, a track-type machine again becomes the logical choice.

H. *Budget* — Smaller landfill operations with limited budgets may have to consider single machine versatility ahead of specialized machines or multiple units.

I. *Growth* — Future increases in refuse volume must be considered to properly size machines.

LANDFILL ESTIMATING

Example Problem #1

A professional engineer has developed a small, rural sanitary landfill master plan. The local legislative regulatory agency has approved the plan and site.

Assume:

Topography: flat
Land availability:
area has several suitable sites at nominal price
Population served: 30,000
Projected population in 3 years: 40,000
Current daily refuse volume: ?
Type of refuse: mostly household, some commercial
Operation: propose 8 hours/day, 5½ days/week
Present equipment: none — new site

What would your comments and recommendations be on the following:?

a. Probable amount of refuse generated daily?
b. Type of machine for the proposed SLF?
c. Size of machine for the proposed SLF?

Solution

a. At three year projected population — 2.26 kg/day (5 lb/day) per person × 40,000 people = 90.4 metric tons (100 tons) daily.
b. Track loader — excavating ability, single machine application based on tonnage requirements.
c. 953C handle current refuse, and has extra capacity for future growth. Small compactor if additional compaction is required.

Example Problem #2

Existing sanitary landfill has been in operation for several years.

Assume:

Type of operation: area fill

Cover material: suitable material within 90 m (300 ft).

Current daily refuse volume: 500 metric tons (550 tons)

Anticipated daily refuse volume in 3 years: 680 metric tons (750 tons)

Type of refuse: household, commercial, large amount of brush and building demolition debris

Land availability: limited, very expensive

Available Refuse Volume: 3 249 125 m^3 (4,250,000 yd^3)

Operation: 8 hours/days, 5½ days/week

Present equipment: D8 (3 years old)

What would your comments and recommendations be on the following:

a. What range of in-place densities could be expected using a track-type tractor; a Cat steel-wheeled landfill compactor?
b. What effect does machine selection have on site life?
c. What are the advantages and limitations of steel-wheeled landfill compactors?
d. What are the advantages and limitations of track-type units?
e. How many machines should be used on the site?
f. What type should they be?
g. What size should they be?

Solution

a. The Track-Type Tractor will achieve 475 to 595 kg/m^3 (800 to 1000 lb/yd^3) in-place density. The Cat steel-wheeled landfill compactor will achieve 595 to 830 kg/m^3 (1000 to 1400 lb/yd^3) in-place density.
b. There are 3 249 125 m^3 (4,250,000 yd^3) available. 500 metric tons (550 tons) per day is how many m^3 (yd^3)? Assume a minimum density of 475 kg/m^3 (800 lb/yd^3).

$$500 \text{ metric tons/day} \times \frac{1000 \text{ kg/metric ton}}{475 \text{ kg/m}^3} = 1052 \text{ m}^3\text{/day}$$

$$550 \text{ tons/day} \times \frac{2000 \text{ lb/ton}}{800 \text{ lb/yd}^3} = 1375 \text{ yd}^3\text{/day}$$

5.5 days/week × 52 weeks/year = 286 days/year

Yearly volume: $1052 \times 286 = 300\,872$ m^3
$1375 \times 286 = 393{,}250$ yd^3

Landfill life at this density:

$$\frac{3\,250\,000 \text{ m}^3}{300\,872 \text{ m}^3\text{/year}} = \frac{4{,}250{,}000 \text{ yd}^3}{393{,}250 \text{ yd}^3\text{/year}} = 10.8 \text{ years}$$

Similar calculations are performed to generate the following tables.

500 METRIC TONS/DAY (550 TONS/DAY)

Density kg/m^3	Density lb/yd^3	Landfill Life (years)
475	**800**	10.8
595	**1000**	13.5
715	**1200**	16.2
835	**1400**	18.9
950	**1600**	21.6

680 METRIC TONS/DAY (750 TONS/DAY)

Density kg/m^3	Density lb/yd^3	Landfill Life (years)
475	**800**	7.9
595	**1000**	9.9
715	**1200**	11.9
835	**1400**	13.9
950	**1600**	15.9

From the tables we determine that a track-type tractor, at 500 metric tons per day (550 tons/day), will provide 13.5 landfill life years at 595 kg/m^3 (1000 lb/yd^3). Compaction will extend that life 5.4 years to 18.9 years at 835 kg/m^3 (1400 lb/yd^3).

Proper compaction techniques are necessary to achieve the higher refuse densities and increase landfill life.

c. Advantages: Provides highest compaction densities extending landfill life.
Limitations: Specialty unit designed to spread and compact — does not excavate virgin material economically, but can handle stockpile cover material.
d. Advantages: most versatile unit, well suited to site preparation, finishing and access road construction and maintenance; all weather machines with excellent tractive ability.
Limitation: compaction — cannot achieve the in-place refuse densities of the specialized landfill compactors.
e. Minimum of two. Additional equipment would depend on supplemental tasks.
f. Track-type tractor — for earthmoving and refuse spreading work; steel-wheeled compactor-quantity of refuse and land cost would justify.
g. D8 — keeping existing unit; D9 — when new tractor is necessary; 826G — with large amount of demolition debris and brush and projected increase in tonnage would justify 826G over 816F.

(**Note:** Ballasting the wheels on Caterpillar Landfill Compactors to increase machine weight and achieve higher compaction densities is not recommended. Landfills are high rimpull applications. Ballasting the wheels will significantly increase machine weight but decrease overall performance when traveling on the fill. Also, wheels are not necessarily air tight or leak proof.)

BUCKET FILL FACTORS

Loose Material	Fill Factor
Mixed Moist Aggregates	95-100%
Uniform Aggregates up to 3 mm (1/8")	95-100
3 mm-9 mm (1/8"-3/8")	90-95
12 mm-20 mm (1/2"-3/4")	85-90
24 mm (1") and over	85-90
Blasted Rock	
Well Blasted	80-95%
Average Blasted	75-90
Poorly Blasted	60-75
Other	
Rock Dirt Mixtures	100-120%
Moist Loam	100-110
Soil, Boulders, Roots	80-100
Cemented Materials	85-95

NOTE: Loader bucket fill factors are affected by bucket penetration, breakout force, rackback angle, bucket profile and ground engaging tools such as bucket teeth or bolt-on replaceable cutting edges.

NOTE: For bucket fill factors for hydraulic excavators, see bucket payloads in the hydraulic excavator section.

TYPICAL ROLLING RESISTANCE FACTORS

Various tire sizes and inflation pressures will greatly reduce or increase the rolling resistance. The values in this table are approximate, particularly for the track and track + tire machines. These values can be used for estimating purposes when specific performance information on particular equipment and given soil conditions is not available. See Mining and Earthmoving Section for more detail.

UNDERFOOTING	ROLLING RESISTANCE, PERCENT*			
	Tires		Track **	Track +Tires
	Bias	Radial		
A very hard, smooth roadway, concrete, cold asphalt or dirt surface, no penetration or flexing	1.5%*	1.2%	0%	1.0%
A hard, smooth, stabilized surfaced roadway without penetration under load, watered, maintained	2.0%	1.7%	0%	1.2%
A firm, smooth, rolling roadway with dirt or light surfacing, flexing slightly under load or undulating, maintained fairly regularly, watered	3.0%	2.5%	0%	1.8%
A dirt roadway, rutted or flexing under load, little maintenance, no water, 25 mm (1") tire penetration or flexing	4.0%	4.0%	0%	2.4%
A dirt roadway, rutted or flexing under load, little maintenance, no water, 50 mm (2") tire penetration or flexing	5.0%	5.0%	0%	3.0%
Rutted dirt roadway, soft under travel, no maintenance, no stabilization, 100 mm (4") tire penetration or flexing	8.0%	8.0%	0%	4.8%
Loose sand or gravel	10.0%	10.0%	2%	7.0%
Rutted dirt roadway, soft under travel, no maintenance, no stabilization, 200 mm (8") tire penetration and flexing	14.0%	14.0%	5%	10.0%
Very soft, muddy, rutted roadway, 300 mm (12") tire penetration, no flexing	20.0%	20.0%	8%	15.0%

*Percent of combined machine weight.

**Assumes drag load has been subtracted to give Drawbar Pull for good to moderate conditions. Some resistance added for very soft conditions.

AGRICULTURAL COMMODITIES CONVERSION FACTORS

	lb	kg	Metric Ton
1 Bushel of Corn*	56	25.40	0.02540
1 Bushel of Soybean*	60	27.22	0.02721
1 Bushel of Oats*	32	14.51	0.01451
1 Bushel of Wheat*	60	27.22	0.02721
1 Bale of Cotton	478	216.81	0.21681

1 metric ton of Corn	39.37 Bushels*
1 metric ton of Soybean	36.75 Bushels*
1 metric ton of Oats	68.92 Bushels*
1 metric ton of Wheat	36.75 Bushels*
1 metric ton of Cotton	4.61 Bales

*Bushel is a volume measurement, 1 Bushel = 35.24 liters = 9.31 U.S. Gallons. In the agricultural mercantile exchange, the Bushel is widely used for grains as weight. For the above weights, the market assumes a standard density for each type of grain.

CURVE SUPERELEVATION IN PERCENT GRADE, TO PROVIDE NO LATERAL TIRE FORCE

Negotiating curves can generate high lateral tire forces. These forces contribute to high tire wear and ply separation. Superelevating the curve helps eliminate these forces. The amount of superelevation depends on the curve's radius and the speed at which it is negotiated.

The following table is a guide for providing the superelevation necessary to eliminate lateral forces.

Superelevated turns present a danger when slippery. For this reason, curves superelevated over 10% should be used with caution. Unless the proper speed is maintained, matching the elevation of the curve, a vehicle may slide off of the lower edge of the roadway. Superelevated curves should be maintained in good tractive conditions.

TURN RADIUS m	TURN RADIUS ft	Speed 16 km/h 10 mph	Speed 24 km/h 15 mph	Speed 32 km/h 20 mph	Speed 40 km/h 25 mph	Speed 48 km/h 30 mph	Speed 56 km/h 35 mph	Speed 64 km/h 40 mph	Speed 72 km/h 45 mph

28

MAXIMUM SPEED ON CURVES FOR VARIOUS SUPERELEVATION GRADES WITH A 0.20 LATERAL COEFFICIENT OF TRACTION

Another approach to superelevated curves is to determine the safe speed for negotiating a turn at a certain lateral tire force. In general, a 20% lateral coefficient of traction is safe for all but slippery conditions. The following table shows maximum speed with various superelevations to maintain a 0.20 lateral coefficient of traction.

TURN RADIUS m	TURN RADIUS ft	Flat Curve km/h	Flat Curve mph	5% Superelevation km/h	5% Superelevation mph	10% Superelevation km/h	10% Superelevation mph
7.6	**25**	14	**9**	16	**10**	17	**11**
15.2	**50**	20	**12**	22	**14**	24	**15**
30.5	**100**	28	**17**	31	**19**	34	**21**
45.7	**150**	34	**21**	38	**24**	42	**26**
61.0	**200**	39	**24**	44	**27**	48	**30**
91.5	**300**	48	**30**	54	**34**	59	**37**
152	**500**	62	**39**	70	**43**	76	**47**
213	**700**	74	**46**	—	**—**	—	**—**

A transition "spiral" may be necessary at higher speeds when entering or departing from a superelevated turn.

*Varies with moisture content, grain size, degree of compaction, etc. Tests must be made to determine exact material characteristics.

**Weights of commercially important wood species can be found in the last pages of the Logging & Forest Products section. To obtain wood weights use the following equations: $lb/yd^3 = (lb/ft^3) \times .4 \times 27$

$kg/m^3 = (kg/m^3) \times .4$
